Yahoo Group Archive:
FT100 (1998 — 2000)

Yahoo Group summary: The Yaesu FT-100 & FT-100D List

These Yahoo Groups messages were archived in WARC format by ArchiveTeam in 2016. This PDF was generated by Digital Library of Amateur Radio & Communications from the WARC files in 2026.

Date span: 1998-01-14 through 2000-12-31, plus 4 messages with implausible archived dates and 2 undated messages

Archived timestamps before 1997-01-01 or after 2020-12-16 are flagged as implausible and excluded from the date span; their original values remain in the message headers and manifests.

Source WARC: yahoo-groups-2016-02-06T12:09:51Z-kklui3.warc.gz

Source item: https://archive.org/details/yahoo-groups-2016-02-06T12-09-51Z-kklui3

Messages included in this PDF: 5885

Message records with no body available in the source archive: 15

Messages omitted as spam from this PDF: 36

Yahoo replaced the domain portions of email addresses with @... in the archived messages. Characters lost in Yahoo's archived text appear as ?.

Messages are presented in ascending Yahoo message-ID order. Gaps indicate records absent from the source WARC or messages omitted from this PDF as spam.

1. Power Connector

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-02 22:08:28 UTC
From: kf6swi@xxxx.xxx
Topic: 1 Message: 1

Anyone know if the FT-100 will have the Yeasu Molex connector (Like the FT-920, FT-847)

2. Not getting Mail

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-05 01:51:47 UTC
From: ozdream@iname.com
Topic: 2 Message: 2

Hi is this list moderated?

I have posted twice and don't get mail from this list.

I run two other lists so I know how the system works.

Thanks, Glen

3. FT-100 Of Course

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-05 02:04:41 UTC
From: ozdream@xxxxx.xxx
Topic: 3 Message: 3

G'day all I am thinking of buying a FT-100 as I plan to due a lot of traveling in Australia next year and want a compact all band radio.

My main interest is 6 and 2 meter DX (Yes there is DX on 6 and 2 for the HF types out there! :-)

So how does it compare to say a Icom 575-275 or Yaesu 736R etc on Six and two?

Is there any problems so far with this radio and does anyone know of any"Real" reviews not the type that get magazines sold but done by people that have USED the radio and know how other radios are.

Thanks, Glen

Hi All, I wouldn't say this list is moderated.
I would say that it is subject to foulups like anything on the internet.
Please let me know of any problems.
Glen if you are not seing any messages check your settings on onelist.

Hi Glen,

I got your mail just fine.

Maybe the list is sort of like the FT-100.....

A long time in coming.... (Hi HI)

10. Response from Yaesu

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-07 13:35:14 UTC
From: Dan Elekman
Topic: 10 Message: 10

Here is the response I receive from Yaesu when I asked why the ship date is now late March.
73, Dan AA9NK

Dan,
Thank you once again for your inquiry as to when we are finally going to release the FT100. I understand how frustrating it is. You should walk a mile in my shoes!!!! We have been told the radios are now ready and we are simply waiting on them to be shipped to us. I do not feel it will be late March, but I can not promise you it won't be. There was no "serious technical issue" only a few minor issues that had to be resolved. And now those have been taken care of. Please allow us a little more time and we will deliver the radio as soon as possible. We truly appreciate your comments and patience.

Best regards,
Neil Sims N5OC
Regional Sales Manager
Yaesu USA

11. Re: Response from Yaesu

Well My bet is that There are problems.
Every radio I have ever owned from YAESU (except me ft2500) has had to go back at least once for a new CPU or firmware change.
Yaesu makes neet hardware but their software guys are not on the same page as the hardware people.
I am sure that the Ft100 is no exception. They are under a lot of pressure to deliver a problem free radio. Thay have a LOT riding on the ft-100. We will see.

Hey FT100 enthusiasts!!

Now that we know the when!!!...The next question will be HOW MUCH?
Does anybody have any idea of the expected price? Will it be much
cheaper than the IC706? I hope so!
Being in Australia, I will not expect to see the FT100 over here for a
while....but will be interested to hear opinions from all of you in the
U.S.

Excellent! Be sure to tell us all about it. I just talked to AES Las Vegas and they are expecting their shipment from Yaesu today. I'm number 2 on the backorder, so I was told that it will definately be shipped out the same day they arrive (should be today). So...should have mine Tuesday.

I also ordered the YSk-100 sep kit and the Diamond 62m duplexer.

Once everything gets here it should take about 5 minutes to install if everything goes as planned.
Power...ready to go (if its the same power connector as the 847 which I understand it is)
Antenna...ATAS-100 to a Quad Magmount on top of my Blazer
Coax...Already run to the compartment where the FT100 will be mounted
Face mount...already fabricated a piece wich fits like a glove into my coffee cup holders. It can easily be pulled up and set onto the top of dash so that Its at eyelevel while driving, or left in the cupholder while mobile and just monitoring.

From: Richard W. Solomon
Topic: 19 Message: 19

Tried it out on 20, 15 (CN8 and 9J2) and 12 (OH3), also on local 2 and 450 repeaters. Seems to work OK. I think I have to turn down the mike gain on FM (I tend to swallow the mike). It has 2 small fans on the back that start up with Transmission, not too loud. I think the real test would be RTTY, but then that would croak most radios. The manual is small book size, over 100 pages !! But at first glance seems not too difficult to program.
It has a built-in memory keyer, 50 word CW memory, audio bandpass shift on XMT, plus a few hundred other features. Looks good to me.

73, Dick, W1KSZ

Hi Dick,

Glad to see the FT-100s have made it to New Hampshire! Wonder if I could take you away from your radio to ask a question? :) Does the fan on the 100 run when it is in the receive mode? I remember the early 706s were quite noisy and was hoping the 100s weren't too noisy sitting on the bench. Oh I cant resist (question 1 part B) How is the audio?

Have fun with your new toy es 73

I just got a call from AES to let me know that they received their shipment today. He also gave me the tracking number for my order which is also being shipped out today. So...I should have the radio Monday afternoon. I can hardly wait.

I was very impressed that AES called me to update me on the status. Excellent customer service!

Unfortuneately the YSK-100 remote kits haven't arrived yet so its still being backordered.

The power connector is some wierd looking thing I have never seen
before. DC Line has what looks like automotive fuses (2X25A).
Both antenna connectors (on pigtails, not chassis mounted) are
SO-239. One is for HF/6 the other for 2/450.

Power connector is some weird automotive type on a pigtail. Both COAX
connectors are SO-239.

One observation I have is that if you turn the car on with the rig on (direct to battery), the radio gets spiked and you have to reset. SO, unless you build a protection circuit, turn off the radio before you start the car. This happens in both my F150 and my friends explorer (we both have the radio).

I ordered a FT-100 from Austin Armature Radio on Friday. They had them in stock and it's arriving second day air tomorrow. I also ordered the 6Khz wide AM filter thought it might be neat to SWL in the car. Has anyone had any experience with the Yaesu mobile antenna? I am using an Outbacker now with a TenTec Scout but it's kind of a pain to keep getting out to change the tap. If the performance of the Yaesu screwdriver is better than the Outback antenna it would be a good motivation to change.

31. Some Interesting Features

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-23 01:03:37 UTC
From: Richard W. Solomon
Topic: 31 Message: 31

I gleaned these from the manual, haven't tried them all yet:

CW Reverse Mode; moves RCVR passband above & below BFO
DSP Mike Equalizer; alters XMT voice passband (this does work !!)
Dual Watch Operation; Checks other VFO for signals periodically
Spectrum Scope Operation; displays activity +/- 15 channels.
Time-Out Timer; For you long winded types on the Repeaters.
CW Identifier; Can be activated when you leave vehicle, plays your ID in CW. That should surprise the rip-off artists.
CW Electronic Keyer; Straight Key, Bug or Iambic
CW Memory (50 character)

How much more can you stuff in this little box ??
73, Dick, W1KSZ

Did you get an estimate on the separation kit?

Has anyone?

I have mine mounted in the truck, but I still want the kit because I cannot reach the VFO knob without bending over so it is a bit dangerous. Of course, since I have a Ford truck, I run the noise blanker and the Digital Noise Reduction at 16 to be able to hear anyone.

Does anyone experience a problem that while you are tuning in SSB, the receiver seems to stop receiving until you stop tuning? The S Meter stops and you hear intermittent sounds like the band. If I power-cycle the radio, it stops and I go back to normal tuning. It seems like the synthesizer is not locking properly. Anyone experience this?

37. Mic Noise on FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-23 22:18:51 UTC
From: 2K-plus
Topic: 37 Message: 37

Has anyone had the opportunity to monitor the audio on their 100? I have noticed two things. One the audio quality is *very* good. I have played with the DSP TX settings and shifting the carrier offset and you can get a very wide range of audio sounds to the rig. The other thing I have noticed is that the hand mic (at least the one on my rig) is very sensitive to breath noise. When talking your breath actually creates popping in the audio. I have started talking into the top of the mic across the face and this seems to eliminate a lot of the problem but it is almost as if there is no foam windscreen in front of the element.

Anyone else notice this?

39. Re: Mic Noise on FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-23 22:27:54 UTC
From: Thomas M. Schaefer
Topic: 37 Message: 39

Someone did say I had this problem. Remember, the mic audio gain of 50 (default) is high. I have found that 40 works better on several radios around here.

From: 2K-plus
Topic: 40 Message: 40

Don't get me wrong I'm having a great time with this new FT-100 but I am also noticing a few strange things like... I have it hooked up to a 10 element log periodic at 45 feet pointed toward Europe and I'm getting (images?) of European SW broadcast stations all over the 10 meter SSB band. Anyone else notice this. Right now 22:44Z I'm getting a strong AM music station on 28.438???

I forgot about that problem! I was listening to WWV on 10.000 AM and I heard broadcast stations with it. I switched to 5.000 AM and they were not there.

Anyone else have the same problem?

I was playing with the demo model at the local ham store the other day and
I heard the imaging you mentioned. This was on 75 meters at
about 3.800 mhz. As I was tuning I heard several commercial stations
(music, commentary) reminded me of 40 meters with the short wave
stations coming through !!
Has anybody else noticed this anomoly ??

From: Michael Jones
Topic: 43 Message: 43

Thankfully, my FT-100 arrived today...
Unfortuneately, its either going back to AES or back to Yaesu ASAP.
I love everything about the rig so far except it has 1 major problem, There is something wrong with the transmit ciruitry on 20m.

Basically, as soon as the carrier is modulated, it stays modulated...kinda oscilates. It makes the transmission completely unreadable. The first HF contacts I tried to make on it were on 20m and 2 YLs thought someone was trying to jam them.

Works perfectly on all other bands/modes.

From: Michael Jones
Topic: 35 Message: 44

I had this happen to me and I was able to force it to happen every time, but I'm not positive its the exact same thing.

If I accidentally hold doen the up/down button too long the radio goes into scan mode, then if I turn the VFO knob by had it clicks and pops. The solution is to tap the PTT which stops scan mode (also doesn't transmit) then the VFO works normal. Watch for the scan icon in the left corner...

I LOVE the cool animated icons!

Subject: [FT100] Tuning oddity

Does anyone experience a problem that while you are tuning in SSB, the receiver seems to stop receiving until you stop tuning? The S Meter stops and you hear intermittent sounds like the band. If I power-cycle the radio, it stops and I go back to normal tuning. It seems like the synthesizer is not locking properly. Anyone experience this?

Hi Michael,

Any Possibility you are getting RF in the rig on 20M? Have you tried it
into a dummy load while listening on another receiver or switched antennas?

Just a thought.

I suppose its certainly a possibility as I must admit I don't know anything about that topic or what to expect. I can tell you that it happens on both my ATAS-100 and my old Hustler system, both of which are in the same proximity to the radio, but with different coax. I can try it into a dummy and listen on another receiver, maybe you can tell me what I should or shouldn't expect to hear.

Other then the 20m problem, I love the radio...
I checked in to the HHH Net tonight (0700-0900UTC 7.235MHz) and worked 7 new states while mobile.

47. What is the FT-100s ancestor?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-24 09:29:53 UTC
From: Michael Jones
Topic: 47 Message: 47

For the most part I've assumed that the 'roots' of the FT-100 were going to primarily be from the FT-847. After getting to know the rig's features a little bit and after about 50 various contacts on HF I think I've changed my verdict.

I strongly have the impression that the rig's HF roots are from the FT-920. Nearly all the options in the radio mirror the 920; especially features that are either nonexistent or stripped down in the 847.

Here's a quick list of what I see in common with the 920:

QMB mems, Mic EQ, Dual Watch, DSP (superior to 847) Memory Keyer, VOX, IPO, AGC, M>V, V>M, Full QSK, CAT, Memory Grouping, Variable Speech Processor, strong adjacent signal rejection.

Probably even more...

Michael,

Running it into a dummy load you should get no R feedback so if you do try it with a dummy load and 20 meters works ok than that would indicate it is an R problem. If on the other hand the problem still exists you might try a reset (they always suggest that when you call tech support).

I have a question about the ATLAS. Does it get it's operating voltage from a 12vdc source and just the control information from the coax (you run 2 wires to the ant)? I am trying to figure out if I can run the ATAS-100 from a detachable trailer hitch mount as I need to put the Jeep in the garage when it snows so they can plow.

Thanks and GL

49. Installed the AM filter (not for the fainthearted)

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-24 13:50:27 UTC
From: 2K-plus
Topic: 49 Message: 49

Just put the AM filter in my FT-100. Not like plugging a filter into the MP :-) Lots of small ribbon plugs to remove and definitely needed my reading glasses to do the soldering. If you do this inhalation make sure to use the Errata sheet that comes with the radio as the manual has the filter in the wrong place on the PC board and it would be *no* fun to have to unsolder and reinstall.

The filter is definitely worth the trouble if you want to listen to short wave AM or broadcast.

50. Fuel Pump Noise.

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-24 14:30:06 UTC
From: Alan Seyboldt
Topic: 50 Message: 50

I have had my Ft100 for now almost a week and have really enjoyed it. I own a Ford Explorer and have a fuel pump noise problem that I don't seem to be able to get fixed. The DSP has made it so that I can use the radio in this poor environment. I am impressed with the radio's ability. One problem that I have found is that you can't raise the CW side tone volume. This makes mobile CW hard because I can't hear myself very well.
(probably that is good! hihi) I did notice the same problem that Tom NY4I had with tuning the VFO and having the receive drop in and out, however if you use the up and down buttons you don't get it.

Also I do not seem to be able to Manual adjust the antenna as per the distructions in the manual. Pushing the PTT and holding the up or down button does not seem to make any change in the antenna's position.

Off the topic slightly: Any advise as to how clean RFI wise a Jeep Grand Cherokee is? I do not want to ever buy another car that has such a problem as my Ford Explorer.

Hi Alan,

You can adjust the CW sidetone. I just learned this from Thomas M.
Schaefers post to this list.

****
The CW sidetone level and keypad beep level are internally adjustable. To

>Best Regards, Mike Krueger - N6MIK, Yaesu Technical Support

****

I also have an article I got on dejanews about adjusting the ATAS-100 that
I will be glad to email you.

And finally. I have been using a TenTec Scout in my Grand Cherokee and it
seems quite quiet. I don't know if that's the Scouts fault or the Jeeps
fault but I will be happy to let you know how the FT-100 works if Yaesu
ever comes out with the separation kits.

> and listen on another receiver, maybe you can tell me what I should or
> shouldn't expect to hear.
>

My suggestion would be:

Using the normal antennas run a couple of test. Observe the power you are putting out. The SWR you are reflecting. Touch the radio, Coax, Connectors and any other cables and observe if the SWR or power changes, or, if you feel any RF hot spots. Use another receiver, with the RF gain reduced to prevent overload, to monitor your audio. This way you will know what to listen for when you switch to the Dummy load. Test the radio both on 20 meters, where you are having the problem, and on a couple of bands that you are not having the problem. Note any differences between the working bands and 20 meters.

Then terminate the radio into a Dummy load and repeat the tests. You should expect not to have any problems with swr or hot spots while using the dummy load. If you do the dummy load and/or coax is bad or there are serious problems with the output circuit of the radio. (Not likely on a modern broad band non-bandswitching rig)

If all else seems ok but you still hear the same problems with the audio then it probably means the trouble is internal to the radio, which will need some warranty repair.

Good Luck and let us know.
Don't hesitate to e-mail me if you want more details on testing.

Have you taken it to a Ford Dealer? They have a fix for it that installs a filter on the fuel pump inside the gas tank. If you are under warranty they will do it labor free and you just pay for the parts. Otherwise you have to pay for both parts and labor.

Did you do the fuel pump test to make sure it is not alternator whine? Let the truck sit for an hour to let the fuel line loose its pressure. Turn on the radio then turn the key to the run positions but do not start the truck. If the noise starts then stops when fuel line charges, the problem is the fuel pump. If you only hear the "whine" when the engine is running and it changes pitch with engine speed it may be alternator whine. My explorer has alternator whine on my vhf rig which was cleared up by putting a DC filter in battery feed.

54. FT-100 Dead

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-24 20:37:07 UTC
From: Michael Jones
Topic: 54 Message: 54

Well, it appears I got a lemon, my FT-100 is essentially dead. I'm going to call both AES and Yaesu after I send off this message. It turns on and everything looks fine, but it barely receives, doesn't transmit, won't tune the ATAS100, for that matter it doesn't work on ANY antenna.

I have no idea what is going on...any guesses? Questions?

55. ATAS mounting and control

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-24 21:03:15 UTC
From: Michael Jones
Topic: 55 Message: 55

The operating voltage is supplied by the radio through the coax when it is in the tune mode. I have mine mounted to an H pattern of 1/4" x 2" alluminum. Each 'leg' has a 5" covered magnet. The coax run is an off-the-shelf component from Comet; 5 meters of coax, detachable pl259, detachable right angle so239. The assembly is made to attach to their mounts or directly through the roof. I simply drilled a 5/8" hole in the center of my mount and attached the assembly there. Then the ATAS screws right on. The whole thing is perfectly stable at 80+ mph with a 40+ mph crosswind.

<snip>
Also I do not seem to be able to Manual adjust the antenna as per the
distructions in the manual. Pushing the PTT and holding the up or down
button does not seem to make any change in the antenna's position.
<snip>

I couldn't get it to work at first either until I tried the up/down buttons
on the radio instead of the mic. Hmmm, it might also work with the p1/p2
buttons on the mic if the mic is still in the default programming state.

Subject: [FT100] Tuning oddity

Does anyone experience a problem that while you are tuning in SSB, the receiver seems to stop receiving until you stop tuning? The S Meter stops and you hear intermittent sounds like the band. If I power-cycle the radio, it stops and I go back to normal tuning. It seems like the synthesizer is not locking properly. Anyone experience this?

Topic: 58 Message: 58

Well, here's an update on the status of my dead FT-100

Called AES LasVegas and spoke with the manager. He said they couldn't exchange or replace the radio, and that they are not yet able to repair it. He got kinda upitty with me so I told him to calm down or I'd dispute the charge via my credit card company. I asked him to come up with a solution and call me back. No word from him yet, though he did mention in closing that his recomendation was to call Yaesu.

Called Yaesu Cerritos customer service. Was told that they repair/replace at their discretion as per the warrenty enclosed with the radio. I expressed that I would like a new radio, not a repaired radio considering that its only 1 day old. She explained to me that it is their policy to always attempt repair before replacing. (I suspect its going to need complete repacement anyway because it has had several problems before it went belly-up. So, my goal was to attempt to secure an immediate replacement. Then it wouldn't take so long to have the radio) I also attemted to get an approximation of how long it might take to fix the radio. They have no idea because they've never had to repair one yet. I was also told that it was 'standard policy' for Yaesu retailers to exchange defective items within the first 10 days of purchase and that most retailers will do so for 30.

Called Citbank. They are fully prepared to dispute the charge for the radio. They feel confident that even if the dispute went to arbitration that it would come out in my favor. So...that opens up the possibility of returning the dead radio via dispute, then buying another radio elsewhere. Unfortunately, that will take quite awhile to resolve; plus, noone seems to have FT-100s in stock yet.

Called the AES corporate office in Wisconsin. The person I needed to talk to was in meetings all day, I'll have to try to contact him tomorrow.

Any comments, questions or suggestions?
This is an entirely new arena for me...I've never had a difficulty like this with anything I've ever purchased. There have been times in the past where I've purchased defective goods and all I had to do was return it promptly to the store of purchase and they exchange it...Am I expecting too much? Is there something that I should do differently?

Any ideas would be *greatly* appreciated!

The boys at HRO in NH told me that they would replace the radio if it croaked in the first 10 days (said the same when I bought the FT-890 and before that with the FT-990). Of course they don't have any left (only got 3 !!), but at least they would take it back. Tell those "Customer Friendly" types at AES that !

From: Alan Seyboldt
Topic: 60 Message: 60

Well the first one seems to have croaked. Tom NY4I was talking to me on the way home and he noticed that his power out went to nothing. Upon looking at it at my house we put a meter on it and noticed that it gives about 3 watts out on full power. We reset the rig and same problem is still present.

Here is my fear. I noticed when I operate that I can smell something WARM so I put my hand by the radio and sure enough I have a good heater going in the corner. My usual talk time is around 30 seconds on and off for 30 or so. I may get long winded and go for more than that, but this should handle this just fine. I am concerned by the heat that is put out. BTW I do not use the ATAS 100 for 144 or 440, instead I use a Diamond dual bander that is a good match for those bands.

What do you all think about the heat?

BTW Toms finals are toast on 144 and 440. Hf is still ok.

Make that the second one seems to have croaked...
Sigh, sounds exactly like my rig. All I have to do is turn my rig on and the screws on the side of the rig get hot enough to hurt; the bare metal on the back of the rig downright burns. I don't know if it was like that yesterday when everything was working, but its that way now...

Good Luck,
Mike

Hi Michael,

Do you have power out on 144 and 440. I am not sure that the heat is bad, I am just concerned that Tom's finals seem to have croaked. I do not recall that much warmth being generated from my other rigs. I have backed down the power to 75%. I would really be interested to hear if you have full output on 144 and 440. If you do not have full output then this may be a concern.

From: Michael Jones
Topic: 60 Message: 64

Unfortunately it changes...if I hit the PTT I either get about 2 watts with a minimum SWR reading (I'll call this 'no-power-mode') or about 90 watts with and infinite SWR reading(I'll call this 'over-power-mode'.) How's that for bizzare! I see the same reaction on 40m through 6m except I don't know the actual figures.

I can also predict which 'mode' is going to happen before I push the PTT. First, I bring up a local repeater with another rig; if I hear the repeater without the S meter registering I'll get the 'no-power-mode'; if I don't hear the repeater I may or may not get an S meter reading it will be in the 'over-power-mode'

The one thing that is always 100% consistent is SWR vs Power. SWR low = Power low; SWR high = Power high.
I usually get the over-power on 2m/70cm and the infinite SWR on HF/6m

Mike,

What type of antenna are you using? I know that this sounds dumb to ask, but to get the reactions that you are getting sounds like you don't have a good load. Have you checked the output to see that you have the correct antenna output chosen for each antenna?

What I would do first is to put a dummy load in line and do some testing, if you get good results at that point, then look at your antenna or your feedline. Ohm out your feed line and make sure that it reads open (without the atas in line if you are using one) the atas will read as a dead short.

I would not use it until you check the feedline for dead shorts or test your antenna setup.

Topic: 60 Message: 66

The intended antenna of final use is the ATAS-100. However, it does it on any antenna, any port, any load.

Antennas tried on the 2m/70cm port: Comet SBB5NMO dualband to a Larsen magmount, ATAS-100, Cushcraft 13b2, dummy load. The two mobile ants check out on my FT-8100r the beam checks out on my FT-847. SWR is 1.1to1 on all the VHF/UHF ants as well. Have not checked coax for shorts, but I will; never hurts to be thorough.

Antennas tried on the HF/6m port: ATAS-100, Hygain TH7DX, Hustler mast for 6m. These ants check out on both my FT-920 and FT-847. Have not checked coax on these either.

Not using it at all anymore. Still determining if its going back to AES or to Yaesu. I just got information tonite that it might be California law that they are *required* to exchange the product if it is found to be defective within 10 days. I know Yaesu will fix it, but at this point, I want a new one.

Any new info on your end Alan? What you described is very similar to what I've experienced. It certainly can't help to compare notes.

73,
Mike

Michael:
I guess one more question is if the fans are running. I finally got mine on to my service monitor and ran some transmit tests. Aside from some wierdosities with power output on AM modes it all seemed to be fine. I ran some long term transmit tests and including several minutes at 100 W on 10M FM. Yes the screws on the side did get pretty warm, but the fans seemed to be doing a good job of dumping the heat out the back. Within a minute or two of not transmitting, the temperature of the screws was substantially lower. On SSB, while easily getting 90 to 100 watt peaks, my average power on voice was generally between 20 and 40 watts, even after messing with the mic level, DSP, and processor settings. At that level there seems to be absolutely no heat problem no matter how long I talk. Your comments regarding either hearing the repeater or not got me thinking. My first thought was that there might be a problem with the way the SO239's are crimped on the output cables. I've never liked that approach, much less using SO239's. The next thought was if you had some kind of adapter from Radio Shack you were using on the antenna connection. (I've seen some pretty bad ones.) My last thought was for the antenna relay inside the radio. While the type of relay they use is fine as long as there's no load problems, if the relay happens to be in a current node due to a faulty antenna, cable or adapter, it can get destroyed pretty quick. I did test the reflected power protection on my FT100 and that seemed to work OK, but you never know. Assuming that you've done a good job of eliminating any problems with things you're connecting to the radio, the antenna relay or something like it would be a possible culprit for that symptom. Of course, it could be "something completely different".
Hope you get it all sorted out or the unit replaced. In all my interaction with Yaesu, they've never let me down (like Kenwood has).

Both fans were running. If I remember correctly, the tuning knob side is pushing air into the rig and select knob side is blowing air out.

>on to my service monitor and ran some transmit tests. Aside from some

If I simply turn the rig on the sides of the rig get very warm (especially select knob side near the rear) and the metal on the back near the fans gets hot. If I let it sit for about 5 minutes the screws and back get hot enough to be VERY uncomfortable to touch. Thats all with 0 transmission time.

I'm tending to think its in the 'other' category, but I openly admit that what I know about much of this is pure theory, not hands on experience.

> Hope you get it all sorted out or the unit replaced. In all my
>interaction with Yaesu, they've never let me down (like Kenwood has).

I have 100% confidence in Yaesu taking care of the problem. Even with the problem rig the only thing that has me upset is the unwillingness of AES to immediately exchange the radio (even if I have to wait for the next shipment to arrive.)

I know I've made a ton of posts to the list about this...I don't want everyone to think I'm being a crybaby, I just want to share my info and experiences so that we can all learn from them.

Hmmm, I tried to look at the fans carefully as they stopped to see if that was the case. I was pretty sure that both of my fans were going the same direction with the air blowing out. In any case, I can feel warm air coming out of both fans. I can't imagine an engineer designing a cooling system where the intake and exhaust are next to each other. Clearly that would cause the unit to recirculate warm air and would severely limit it's cooling ability. Also, in peering through the fans it's clear that they aren't ducted to separate the flow. From that I'd say that if your fans are running in oposite directions or one is mounted backwards that you could expect the unit to overheat--perhaps even just in receive mode after a while.

Hi Michael,

Are you using a common antenna, i.e. the atlas, with a duplexer for the two outputs on the rig? If so have you tried removing the duplexer and trying only HF or VHF/UHF to see if the problem clears up?

Just a thought from who does not have the FT-100 yet.

Good point Alan, Seeing as how there are separate outputs for hf and vhf/uhf it seems more likely that a common problem would be external. I am guessing that the final power stages for hf and uhf are different so a common problem would have to be in the exciter which does not seem likely for the problem Mike is having.

Can you measure the current draw of the rig in this state and compare it with the specs? If you are drawing excessive current for the receive mode I would guess you had a short somewhere in the radio. From your description I would guess it may be the final amp stage.

From: Thomas M. Schaefer
Topic: 73 Message: 73

Well,

Yaesu Engineering wants to see my radio. They asked that I send it back to Cerritos. I was also told that if Yaesu Japan Engineering wants to see it, then they will replace the radio.

To re-iterate the problem, I was running on 144 TX Power at 30 % for a week, I moved it up to 100%, started a 2m QSO on a repeater for 5 minutes, and the meter stopped registering. It looked like I was no longer transmitting, but I was still getting into the repeater. I checked it on a power meter and the radio was outputting 1 watt on 2m, less than a watt on 440. The antenna was checked on an antenna analyzer and presents a good load.

The dealer does not have one to replace it with, so off it goes to Yaesu (Damn!!!).

My first Yaesu HF radio may be my last depending upon this experience.

One more thing...HF still works fine!

I will keep everyone posted...

73,

Tom NY4I

My 'final' installation of the rig would have been using a Diamond duplexer into the ATAS. However, me temporary installation in the vehicle was using separate antennae for each port. Thanks for the suggestion Mark.

I did test this on initial installation and it was appx 1.5 amps.
Unfortuneately, I didn't test this after the rig went freaky. I've already
boxed the radio back up, but I might hook it back up just to see. Would a
high current draw on receive indicate something in particular?

I was told today that they would like to see the radio as well. I will probably be hand delivering it to them on Monday afternoon. They said they have no idea how long it may take to fix (if they decide to fix it) because they have never had one open before. I was told that if they decide to forward it to Japan that they would drop ship me a new radio.

Good Luck Tom,
Mike

Well,

Yaesu Engineering wants to see my radio. They asked that I send it back to Cerritos. I was also told that if Yaesu Japan Engineering wants to see it, then they will replace the radio.

To re-iterate the problem, I was running on 144 TX Power at 30 % for a week, I moved it up to 100%, started a 2m QSO on a repeater for 5 minutes, and the meter stopped registering. It looked like I was no longer transmitting, but I was still getting into the repeater. I checked it on a power meter and the radio was outputting 1 watt on 2m, less than a watt on 440. The antenna was checked on an antenna analyzer and presents a good load.

The dealer does not have one to replace it with, so off it goes to Yaesu (Damn!!!).

My first Yaesu HF radio may be my last depending upon this experience.

One more thing...HF still works fine!

I will keep everyone posted...

73,

Tom NY4I

One of the first things I would suspect from excessive current draw would be a short. If the heat is coming from the area of the final power amps I would suspect that they have been fried. One remote possibility is that something is causing them to go into a runaway oscillation but if this were the case it would probably swamp your receiver and you could hear it.

Not worth checking out if they want it back. Although it would be nice to know what they find. Good luck I hope you have a short turn around in getting a new one.

Hi Richard,

Yes I have had the same thing occur with my radio, however, I have not been
able to duplicate it again. Some sequence has been followed to make it
occur. BTW read my post on the heat and give me your feelings about it.

Hi all. I got mine today. How did you all get them? I was thinking I got in on one of the first shipments! (That was a rhetorical statement ~)

Anyway, I was looking at the archives and noticed the Ford fuel-pump filter recommendation. Yes, we have the Ford white filters designed to be fitted in the tank. But that is a bother.... I found they work very nicely if installed in the power lead of my TM-741 instead. Much better for me.

Also, I am disappointed that the receiver specs on the sheet from Dayton last year mentioned 100KHz to 970MHz. Did they eliminate the general coverage reception?

Well, I am about to power it up for the first time. Cheers!

Dank:
Well, compared to the 706MKII I've been using in my mobile since last summer, it's a world of difference. I don't know if some of this has been fixed in the MKIIG or not, but there are numerous things I really don't like about that radio.
The FT-100 has so far performed pretty well and all signal quality reports have been good. I haven't yet done any receiver measurements, but my guess is that it's very adequate from the way it sounds. The nice thing about the DSP is that it works and it's really useable. I did some playing with it last night and decided that the noise reduction (clearly adaptive filtering) will be usefull in certain cases. I was less impressed with the DSP notch filtering which wasn't as deep as I would have expected but certainly is adequate to get hetrodynes out of the way. I was however more impressed with the variable DSP bandpass filtering which was very effective for separating SSB signals from other nearby signals and was even pretty good for CW filtering. The really nice thing about the noise limiter vs the one on the 706MKII is that it actually works. The 706's noise limited is for all practical purposes useless, is a real anoyance in strong signal environments and downright hazardous on SW AM broadcast. The FT-100's by contrast is highly effective, variable, and seems to be very tolerant of strong nearby signals.
One thing I was slightly dissapointed with was the scope of the speech compression on the FT-100. I was hoping to be able to turn it all the way up and have breathing between words keep the transmitter at full power. No such luck, you can't push it that hard, not that I would normally run it like that, but there are times I would like to have things highly compressed. Offsetting that however are the low cut, high cut, transmit audio options, and other transmit audio tweaks which will prove helpfull.
Functionally, I like it, particularly the number of dial speeds available, which will help in the mobile. I'm not so thrilled about the number of menus which can be an annoyance for mobile operation, but they are at least all accessable in the same way rather than the 706 which has 3 sets of menus where you have to have the correct set before you find the right menu. I do like the way you can quickly get to the variable configuration functions for many of the menu items by simply holding the button for a second. Also the number of configuable parameters is overwhelming. If I have any ergonomic complaints I'd say the buttons are a little tight around the main tuing dial, but I haven't tried it mobile yet to see if that's going to be a problem.
While it's certainly not a replacement for a good dual-band UHF/VHF mobile, it's at least not functionally crippled as the 706MKII is on VHF. (I swear, the next time I move to an HF band and end up transmitting on a repeater input frequency the 706 is going to be ejected from the window at highway speed.) I'm probably going to pull the 706 from the vehicle and put in the FT-100 along with my FT-8100. That will give me a good VHF/UHF

dual-bander and I'll be able to work sideband modes on 2 and 432, as well has hf/6, with the FT-100. My truck is going to have a few antennas, but what the heck!
Yes, there's a lot good about the FT-100, as far as I can tell at this point. Hope that helps...

Mine will tune up to 960.999Mhz But it seems kind of dead up there. I
haven't had the chance to test the sensitivity. The easiest way to get
there is go down to the AM broadcast band and tune backward in Mhz steps.

As one of the ones that has been reporting a few problems, I have also maintained (and still maintain), I like the radio. The DSP noise reduction is amazing. The menu setting for the noise reduction go from 1 to 16, it should go from 1 to Ford.

My audio reports on 2m/440 have been "it's the best I've ever heard you" and "you sound at your best". Great audio. The receiver is dead quiet (with my ignition off). I agree about the menu buttons, but after I put several frequencies with mode combinations in the memories, I can get to where I want with the memory, and then just tune around with the VFO.

If you are considering one, keep in mind that it is NOT a dual-bander. I may consider running a separate 2m/440 rig to monitor repeaters, etc. At least I may put a scanner in the car so if someone calls, I can flip over...

Hey, the blue is nicer than the Green of the 706... BTW, I am ICOM through and through, but my last two purchases have been a Kenwood D7A handheld and the FT-100. Go figure...

Tom NY4I

Nothing personal Tom, we're kindred spirits with bum FT-100s, but I can't stand lists that reply to the poster and not the list. The point of the list is a continual exchange of ideas between all of us to all of us for all of us. To me that should be the 'norm.' In my experience, lists that default to the poster tend to stagnate; because a conversation gets started, but noone else sees the responses which may prompt even further discussion. If a direct private reply is warrented, its an easy single click on the poster's email address.
This is a flame free post, its ment as a reasoned expression of my opinion, not an attack.

On a related note to "Whats the good word?" I too must mention how much I really like the FT-100 (even though I'm hand returning it to Yaesu monday morning.) I am amazed at the size, and I LOVE the display. The combination of standard backlit LCD characters with a dotmatrix is excellent. The animated icons; though they add nothing to the function of the radio; add a strong element of class to the radio. One function of the rig that I have never seen anywhere before is the 'autolock' of the main vfo knob for am/fm. When I was running my FT847 mobile I found it necessary to hit the lock button when working FM repeaters, the FT100 eliminates the need. Its also much more convenient to have 5 QMBs instead of only 1. The 100 is also much less prone to ignition noise with the NB off then the 847 is; however, I don't know if thats at a sacrifice of sensitivity.

Do I have any gripes...2 that I can think of. I'd like direct frequency entry from the microphone, but its not that big a deal all it takes is a few clicks to get to the band I want and then rotate the select knob to get in the band portion I want then main VFO from there. Another nice ala the FT8100 would be complete programability of the 4 mic buttons. For me the ideal setup would be ACC=func, P=VFO/MR, P1=Band (doesn't matter up or down,) P2=Rev (or maybe just generically either A, B, C or D)

Performance...before it died, no complaints. During the day I worked about a half dozen stateside contacts and one Hawaii. Later that night I worked 7 new states on 40m while mobile including SD, AL, AK, HI, IA, IL, NV and MT (already had IL on 40) that brings me up to about 40 states on 40m. I have my WAS and WAS10m. I also plan on doing a WAS while mobile FT-100

Thanks, all, for letting me know that it does, indeed, get general coverage
receive. When I had posted the question I had not yet fired it up. Can you
believe that?

One of these days I hope to take the radio to a friend's house and play with
his IFR to plot sensitivity. With full coverage there is going to be a lot
of data to plot. If I get it done maybe I will make a spreadsheet file
available to the list, if there is call for it.

Thanks for the comments. I agree with you but I did not want to trouble the other members of the list with specific items. If everyone understands that replies are sent to the list to keep everyone informed, that is fine with me. I did not want to use too much bandwidth. Not a problem. It will be interesting to see what happens with our radios as mine should be there Monday as well. If UPS wants to toss it off the truck...all the better. Well, then I guess they would not find out the problem that everyone else is going to have.

PS Could the person that keeps the list change the onelist setting so that when you reply, the actual sender is listed and not the list? I have all my onelist lists setup that way and it is easier.

PRES>

I don't agree! What happens this way is to reply to the list I must do 3 things...

1 Reply to all
2 go up and remove the sender's name
3 go down and type the response to the list

otherwise the original poster gets the response twice... once directly and once to the list. I can't be bothered to use the above procedure so lists set up this way annoys the sender

HOWEVER if it is set up as "reply to list" then all I have to do is hit "Reply" and go.

I just simply hit "Reply" and its very neatly addressed to FT100@onelist.com. No problems. If you use "Reply To All" as a default,
then that is where your problem is.

I like it this way, please keep it so that we are sending to the list.

Yes, I agree. There was a brief experiment to change it so that "reply" sent
only to the poster, thus requiring "Reply to all" to get the list. That's
what I was objecting to, and it has been changed back, thank goodness.

Thanks for switching it back James. I like it better the original way also. If someone wants to send a private e-mail to respond it is very easy to just reply and then use cut and paste to change the address.

I got mine, but I'm constantly irked that the manual ALMOST explains the functions. It gives you the choices, but doesn't give the
why or why not.

Is there more explanation for some of these functions somewhere else?

98. After one Week

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-27 20:25:19 UTC
From: Alan Seyboldt
Topic: 98 Message: 98

Well I have now had the Ft 100 over one week. I went out to a work location that takes me over an hour to get out to and put the 144 - 440 finals to a punishing test. I was 4min on and 15sec off for over 30min. I do get more heat out of using the Atas 100 antenna then I do by using my Diamond dual bander. I have noticed that I get a much better match out of the Dual bander (not surprising) However I am impressed by what the Atas will do. I worked 35 stations in the WPX contest and got through with others trying the contest station. I do not seem to have anything that really bothers me other than the heat when I use the Atas on 144 or 440. Now that I don't use the Atas for those bands it runs much cooler. I am REALLY impressed with the NB, with it set to 12 I can make my Ford Explorer worth keeping. I do wish that they made the volume for the sidetone easier to get to or just set it higher from the factory.

Would I buy another one, As of now Yes.

99. Re: Manual deficiencies

Yahoo group: FT100 (1998 — 2000)
Date: 1999-03-28 02:41:39 UTC
From: Paul N. Lawrence
Topic: 88 Message: 99

OK, for instance:

1. In regards to the "SWR Meter". There's only a small mention of how to turn it on/off and no explanation that I find for how it
works or what happens when SWR is too high. What is too high? On what bands does the "SWR Meter" operate?

2. The manual seems to be a detailed outline of the radio's menu structure. I've had many Yaesu radios with more detailed manuals.
This one is barely over 100 pages (8"x5"). It barely has a Table of Contents and doesn't even have an index. I don't see how they
kept all the details out. Where's the Yaesu beef?

3. Does the radio have a way to set the power output on "50M" without going to Menu Item 22? There's no mention of it being anywhere
except there. The little "squiggle" guy on page 47 warns "... set the operating mode before making the power adjustment!" Irk!
Why?

I'm not criticizing the manual, I'm just asking if there is another place where I can get more explanation for some if these "irks"
that come up while I'm setting up and learning this radio.

Topic: 102 Message: 102

Hey Guys,
Not an FT100 owner yet, but I'm drooling. Information on this rig is sketchy.
The reason I joined this list is to try to get some info before I jump into one.

Anyone know of any mods for this rig yet?
How many memory channels does it have 2 or 3 hundred?
Is the receive continuous from 500khz to 970 (with the exception of cellular) and
can that be opened?
How bout the TX?
Does it have PL search/monitor?
How sensitive is it etc.etc.?

It would be amazing if 220 could be found in there somewhere. For a rig that does
so much anything can be possible! Now I'm really dreaming huh?

Any feedback would be appreciated.

Thanks,
Steve

From: Michael Jones
Topic: 103 Message: 103

Well, i just got back from a day long trip to Yaesu in Cerritos. They fixed my radio, but they weren't entirely sure if they fixed the problem or just the symptom. So, they're going to keep it for a few days so that they can be sure it IS operating properly then ship it out to me UPS ground. So, hopefully I'll be back in operation within a week.

I also took a trip to HRO Anaheim while I was there. Fairly nice store, much nicer then HRO Burbank. I picked up an Astron RS35m power supply and a Yaesu MD-100 desk mike for my FT-847/FT-920. While I was there an FT-100 was returned. It died within 1 hour of turning it on. His problem was the only mode that worked was FM. All other modes died. He got his money back, but he told me provately that he plans on buying another.

From: 2K-plus
Topic: 105 Message: 105

Just picked up a YSK-100 separation kit and a ATAS-100 antenna today at HRO. Before I decide to punch a hole in the roof of my Jeep for an antenna mount I was wondering if anyone was having any success with a mag mount and the ATAS-100?

On another note either I'm doing it wrong or it sure is stiff getting the FT-100 faceplate out of the separation mount. Possibly it just needs to be done a number of times, kinda like a childproof cap on an aspirin bottle.

Ya, I'm using the ATAS on a homebrew Alluminum 'H' magmount similar to LakeView ant companies. Its simply alluminum in an H pattern with four 5-inch magnets. Dimensions are 20" front to back and 20" side to side with extra holes for adjustment to the particular vehicle (I have the side to side setup at about 16" so that it fits between my luggage rack rails.) The center is drilled out to accept a Comet coax assembly. All of this is on the top of my Chevy Blazer in the center of the luggage-rack area.

I haven't received my YSK-100 sep kit yet. It was still backordered when my rig came in.

73,
Mike

The secret of removing the faceplate from the separation mount is not to touch the snap piece on the back. Just slide the face plate to the side. This is slightly different than removing the faceplate from the FT-100 radio (where you need to slide the latch).

Hope this helps.

I'm glad to hear someone is actually doing this. I'm considering doing this as well -- only I'd probably purchase such a mount, instead of homebrewing it, and I'd be putting it on the trunk lid of my Saturn SL1. (Doesn't anybody else operate HF mobile from compact sedans? Everywhere I turn for ideas, I find descriptions of mounting rigs and antennas on pickups, SUVs, RVs...)

Apparently it's working well for you (given your previous message where you said you worked from HI to IL on 40m -- any DX yet?). Did you find that the ground plane coupling was sufficient, or did you also add a grounding strap?

When I get more of a chance, I'll post more details about how I went to the hamfest Saturday just looking for info on the FT-100 and IC-706MkIIG, and ended up buying the last FT-100 at the booth of the only dealer who had any. (Apologies to all you folks who are still waiting for their pre-orders to arrive...)

Works great, very happy with it. No DX on it yet with the FT-100 since the
rig died the morning after I did those stateside 40m contacts. However, I
have worked alot of DX off of it when I was running my FT-847 mobile.
Essentially, if I can hear 'em I can work 'em. In fact, my first contact off
of that antenna setup was a JA on 10m.

From: dank
Topic: 112 Message: 112

Happy holiday weekend to all.

I have questions on remotely mounting the front panel.

1. When you remote mount the front panel, where does the microphone
plug in, to the front panel, to the extension cable, or to a separate cable?

2. How easy is it to plug/unplug the front panel, has Yaesu used
a quality connection for this?

3. How long is the remote cable?

Any sources for more details on the FT-100, Yeasu's is limited.
How happy is everyone with their new rig, would you recommend the FT-100?
Any comparisons to the IC-706MKII?

Thanks for your inputs, I appreciate them..

Topic: 112 Message: 113

Mic plugs into RF deck, not front panel. Works good if you mount front panel along top of windshield. YSK-100 includes a "nest" for the control head which is very adequate if you rarely remove the control head from the nest. An additional option may be available that is better. The cable is "quite long" by my standards and these are based on a full size extended cab 3/4T P/U and Suburban perspective on cable lengths. Probably adequate to trunk mount the rig in anything other than a school-bus. The rig is a beauty in nearly all respects. There are a few foibles. I've heard lots of people who prefer the FT100 to the IC706MKII. I've not heard anyone who prefered the ICOM. My own experience is that the FT100 is the functional superset of the FT847 for mobile use. Repetitive unsolicited compliments on the audio quality on SSB are the norm (for both rigs). Sure is fun to have HF in the car!

I answered my own question -- both HRO and AES have them for $79.

It includes the extension cable, the mounting bracket for the faceplate, and
a microphone extension.

And the external speaker extension cable, although I have a large collection
of unused ones of those, since I rarely use external speakers (large
vehicles,
usually don't put the rig somewhere I cannot hear it).

118. FT100 & ATAS-100 Antenna What A Neat Combination!!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-02 00:47:13 UTC
From: 2K-plus
Topic: 118 Message: 118

I have been playing with the FT-100 for the last 9 days here in the shack and making some notes to be used in a review I am writing for a ham magazine. Aside from a few points that I am talking to Yaesu about the rig has been a lot of fun and quite impressive. But... Today I hooked it up to the ATAS-100 that I just put on a 3 post mag mount on the roof of my Jeep and wow! What a neat engineering feat the combination of these two pieces of equipment are. I wanted to test out the setup before I mounted the rig in my Jeep so I placed the mag mount on the roof and ran 50 feet of RG 8X between the rig that was still hooked up in the shack and the ATAS-100 on the Jeep. I started out on 40 meters and the antenna, after about 40 seconds of extending and finding it's bearings got a perfect match and I was able to work a ham a few states away despite the SWB QRM found on 40 in the late afternoon here on the East Coast. I then proceeded to work a station in Belize on 17 meters, HR1RMG/HR6 on 20 meters and a few south west US stations while tuning on 17. The rig control of the screwdriver antenna was quite amazing (and fun to watch) and the added feature of being able to manual tune the antenna with the up/down buttons and have the FT-100 remember the settings was way cool. I also liked the little moving antenna icon and the icon that appeared when a match was found. All-in-all a pretty neat combination and quite amazing how well the antenna put out and received considering it's small size.

just thought I'd post this to break up the technical questions :-P

Hi guys, I'm sure there's a MARS mod for the radio, although I've not seen anyone post how it's done yet, but I've also got one other concern. Will there be a way to open up 11 meters on this rig? I know, why would I want 11 meters anyway..... well only because when I travel in a convoy with friends on certain types of outings we do, a lot of them have 11 meter units of course, and I'd really like to have this FT100 rig handle that for me (set on low power of course) so I don't have to install another rig/antenna in my '99 Ford. I'm also hoping that the FT100 will work as well on FRS freq's as my VX-5R does(using low power of course). Any mods that anyone knows of, please let me know. Thanks in advance,

You're really treading on thin ice here, discussing clearly illegal
activity. Besides, FRS has half the normal deviation so our regular radios
don't match too well (transmit too loud, recevie too soft) although I am
aware that it can be done.

Hello FT100 list members.

I joined the list today. My call is K1XV, and name is Ray.

I am supposedly number 2 on the HRO Delaware wait list for an FT100, so I figure I better join the list. Some of the archive discussion about early failures gave me some thought to cancel my order. Wonder if that is an isolated problem, or are the early sets flawed? Is this primarily a HF problem, or 144/440 problem, or both?

I usually don't buy something that is just coming out. My motto is "you can always recognize the pioneers. They have the arrows in their backs." However, in this case I violated my own rule.

Look forward to getting my FT100, and participating in the list.

73, Ray K1XV

Yes, you can connect the radio using the standard Yaesu CAT. You do need a level converter because it is TTL levels, not RS232C. According to the manual, Yaesu has a special cable the connects to their Mini-DIN and has the level converter build into it. I suspect that if you already have one or choose to build a level converter for CAT, you can just get a Mini DIN plug at RatShack and make your own interface. I have not tried this because I would not buy the level converter from Yaesu, but AS SOON AS I GET IT BACK FROM YAESU, I intend on doing this and hook it up to packet.

Topic: 124 Message: 130

Yes the FT-100 has a CAT port for interface to a computer. But, unlike the other Yaesu radios I have it takes a little more work to use then simply plugging in a serial or null modem cable. The jack is a mini-din type and outputs TTL levels, NOT RS232 levels (similar to the data jacks on most Yaesu handhelds and mobile rigs) So, a special cable is required to convert the TTL signals to the standard RS232 levels expected by your computer. Yaesu has a cable abailable for this, or alternately, it is possible to build one yourself.

I have a spare ADMS programming cable that I plan to modify for use with my FT-100 to connect it to a laptop in the car. The ultimate goal is to be able to contest as a mobile/rover station without losing the ability to computer log. If your anyone is else is on the west coast, listen for my call during the June VHF QSO party. I plan on driving from DM04 in the LA area through to Seatle in a slightly zigzag pattern (with a passenger operator of course)

Modifying the radio is NOT illegal. However using it in an
unauthorized/unlicensed manner is another story...

A good analogy might be cars; most of us on the list likely have cars, most
cars are capable of going 80+ miles per hour. Is that illegal? No, its not
illegal until you actually GO that fast. Yet at the same time, if you are a
properly licensed NASCAR driver on a racetrack its OK.

Forgive me for a slightly off-topic post, but I'm relatively new to ham, and didn't want to miss an opportunity to learn. I have an FT-50 that I've used a couple times to communicate with an FRS radio. I am still working to get more of my friends licensed, but it is taking a while, and it is occasionally nice to toss some one a cheap, brainless radio and be able talk with them. I realize that the FT-50 is not "type accepted" by the FCC (although I'm not completely sure what that means), but I don't understand what difference it makes. If I use a "black box" to communication on the same frequency and the same power level that the FCC stipulates for a giving band, is it that important that the black box is Ham or FRS? I am also interested in "11 meter" for much the same reason; there is frequently little relevant traffic on the ham bands regarding local traffic / road conditions, etc. (I've never used a CB, so I honestly couldn't say that would provide any additional benefit, but I'd like to find out). I am not particularly interested in breaking the law, I just want usable, useful, communications.

I joined the list to get more information regarding the ft-100. I like the sounds of it so far, and am really just waiting to confirm all the bugs have been worked out of it. I wouldn't mind having both an FT-100 and a CB, but if I don't have to, it seems like a waste of resources.

What is normal deviation? I thought that was a statistical mathematics construct.

Awaiting radio-enlightenment (while attempting to master code well enough to finish my general ticket)

Modifying the radio is NOT illegal. However using it in
an
unauthorized/unlicensed manner is another story...

A good analogy might be cars; most of us on the list
likely have cars, most
cars are capable of going 80+ miles per hour. Is that
illegal? No, its not
illegal until you actually GO that fast. Yet at the same
time, if you are a
properly licensed NASCAR driver on a racetrack its OK.

Chris, there is absolutely no "information" available on the CB frequencies, but your family will become "educated" rather quickly.
FCC "type accepted" equipment is supposed to standardize and fix parameters for a band. Ham radios are too variable to "control",
thus they require us to "know what we are doing". All hams should know what deviation means as regards to radios.

deviation means as regards to radios.

Well, this doesn't answer his question in saying "all hams should know about
deviation".

Basically, CB is supposed to be 4w output with crystal-like accuracy and
some-dee-some kind of spurious emission quality. A 100w HF radio could never
be reliably set to those specs and therfore illegal to transmit there. That
doesn't stop thousands of freebanders form bootlegging nearby but that
doesn't make a self-policing, law-and-rules- abiding ham right to do it, and
the FCC is starting to finally enforce things. Why lose your license and
risk a fine rather than buy a simple CB handheld for $20 used?

Deviation: the FRS service is designed for a certain power output and
absolutely no external antenna option. Also, they are on narrow-splinter
channels like 462.6625 and so as to not cause interference to an existing
repeater's input they are limited to 2.5KHz deviation. The normal
ham/commercial NBFM set makes about 4.5KHz deviation. Therefore, a robustly
spoken ham will distort and chop out of a proper FRS receiver and cause
interference to regular, non-splinter receivers. Conversely, an FRS radio
will sound weak into a 4.5KHz wide NBFM set.

This is why, neglecting the law aspects, FRS and commercial/ham sets do not
mix well. Nonetheless, many scofflaws do it successfully.

What is interesting though is the fact that a radio like the Yaesu VX5 has a 2.5Khz deviation mode selectable in the menu. I think the question is weather or not the FT100 may or may not have the same facility.

It does: menu 33 allows you to set the FM deviation to 2.5, 5.0, or "HF
2.5" (the default: 2.5 kHz on the HF bands, 5.0 kHz elsewhere).

This item is provided solely for information purposes. :-)

Received my FT-100 back from Yaesu today. It still looks as nice as when I first opened the box. Here's the info on the invoice of what specifically was done to it.

2 chip cap, GRM39B104K16PT $0.09 each
2 chip res, RMC1/16 823JATP $0.03 each
1 chip res, RMC1/16 683JATP $0.02 each
1 chip res, RMC1/16 473JATP $0.02 each
Replaced PA Unit $ no price given
Complete burnin test and aligned to factory specs.

Labor $75
Parts $0.28
Freight $10.06
Credit $-85.34

Total $0.00 Warranty Repair

Unfortunately they didn't list a price for the PA unit, would have been interesting to see what the part cost on it would have been. Anyone know?

I'll post another update tomorrow afternoon after I get it back in the mobile.

73,
Mike

Hi Mike,

I suspect the PA section would have been at least several hundred dollars. Not a bad turnaround time either. Let us know how she works. Of course if you don't show up here too often we will know you are too busy having fun to get on the list.

Have Fun....

I did not get in on the original thread to know what your problem was on the FT100. Can you please tell me was it DOA or what was the problem to require all the replacements?

I'll try to keep the mod debate going...

it would be great if the "mod" got you 220 & 900

the ft-100 would make a great contest radio then

I'm getting mine at Dayton hopfuly there will be a special on them...

Well I talked to one of the Yaesu guys at a ham fest a while back and he hinted at the fact that the mod would cover 220. I was going to get a ft-100 as soon as it came out but, decided to hold of for a while and it looks like I made the right choice! I can't wate till I get it thou! 73's 2 all k5drm!!

Just had my Graduate course in Neurosurgery !!
Actually, it wasn't that bad and it worked after I
buttoned it up. The manual doesn't jive with the
instructions on removing ribbon cables (only need
to remove 2) and the one connector (not mentioned).
However, the FTS-27 CTCSS Decoder just don't fit.
If I follow the manual outline I cover up some cans
with Dbl-Sided Tape that could be a problem. I think
I'll leave it out.
Otherwise, it works great, nice audio reports on SSB
and FM. "Yaesu Did It Again !!"

Okay, here's the update I promised...

Well it seems they fixed the major problem, but I have a sinking feeling that its going to die again. When I first brought it in to Yaesu the tech immediatly noticed that it was drawing too much current which then led to the blown rf amp. Well, according to my power supply meter the poor little thing is drawing 26 amps on transmit. I'm surprised its not blowing the 25 amp fuses. And thats not SSB peaks either, thats a carrier on 2m 50 watts. My 847 and 8100r only draw appx 11 amps at 50 watts.

But, either way, it doesn't matter too much because they didn't fix my 20m problem. Kinda silly considering that the 20m problem existed right out of the box, at least the rest of the radio took about 18 hours to die.

So, the power problem is fixed, but 20m isn't. For those that weren't on the list then, on 20m as soon as I modulate a carrier the power output stays at peak output until the PTT is released. The reception of the signal on another rig sounds like solid FM whitenoise.

I talked to the customer service manager, John Lynn, (they were moving furniture, I expected to get his voice mail) I asked him if they could do a UPS pickup on the radio. He said, "no problem, call first thing monday morning and I'll arrange it." But, I think I'm just going to drive down again. I don't really want to make the 180 mile round trip again (especially with gas prices over $1.50 a gallon here now) but I think it'll save alot of time.

73 for now,
Mike

Interestingly enough, you can set the FT100 deviation to 2.5 Khz.

Hi folks,

Thought I'd drop a line to say that I am also a new and proud owner of an FT-100 with an ATAS-100 antenna. Wow! What a combination!

I made several contacts today on the 17 meter band from my truck (in Oceanside, CA), and received very good reports from all contacts.

The rig is a pleasure to operate. I just wish that it had an alph-numeric display for the memory channels that would identify the repeaters by name instead of just memory location number. It does have 300 memories after all!

Anyway, I've been putting it through its paces and am quite pleased in all respects. For those of you who don't have their rigs yet, good things are worth waiting for!!

First test with 9600 PR are done. It works "too" perfect because the TX-delay is 1-2!!! It was tested with a simplex and a duplex digipeater in the Frankfurt area, Germany. All connections are made from the rearside connectore
and the equipment used was a TNC.
vy 73 and happy Easter weekend from Germany

I don't mean to beat this dead horse, but this just came in to me. It is a reminder that we should take our privileges seriously.
Just because Yeasu has provided this great radio, doesn't mean we should abuse it (even if "thinking about it" isn't illegal.)

I would encourage EVERYONE to send swatch a .WAV file about how they feel!!

you can go to http://www.swatch.com/beatnik/send.php3 and fill in their "send a message to space" thing and well, I say tell them what you think about them doing this over ham radio (as well as sending them a letter)

I'm sure if they get a few thousand of these type of WAV files they might rethink this..

From: Ila
Topic: 154 Message: 154

I just received my FT-100 last week. Does anyone know of a mod to open up the receive frequencies from 450 Mcs to 869 Mcs? Also the transmit mod for 420 mcs to 430 mcs. Any help would be appreciated.

Duke W9GDW

I would encourage EVERYONE to send swatch a .WAV file about how they feel!!

you can go to http://www.swatch.com/beatnik/send.php3 and fill in their
"send a message to space" thing and well, I say tell them what you think
about them doing this over ham radio (as well as sending them a letter)

I'm sure if they get a few thousand of these type of WAV files they might
rethink this..

-Chris

157. Interesting Little Bug

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-04 19:51:18 UTC
From: 2K-plus
Topic: 157 Message: 157

I just went for a short trip to the store and was listening to 40 meters on the FT-100. I turned the rig off when I shut the car off at the store and then restarted the car when I got back in and turned on the rig. And.. low volume (about 1/2 normal level. I turned the volume control all the way up and only got normal listening level volume. I changed bands and even listened to VHF and uhf with the squelch off and no improvement. I then switched back to 40 meters and hit the PTT switch on the mike. When the rig returned to receive everything was normal (plenty of volume. On the way home I duplicated this about 9 out of ten times turning the rig off and back on. I got home and was about to reset the rig thus losing all my user settings and programmed memorieswhen I decided to go through the 9 operational menus and check the settings. I had the noise blanker on so I turned that off and shut the rig off and back on. No loss of volume. Tried it about 6 times and with the noise blanker on the rig would come up with low volume that could be cured by taping the PTT switch. With the noise blanker off the rig would always come up at normal volume output. I haven't tried to duplicate this in other modes or on other bands yet but was wondering if anyone else had experienced this bug?

Also, just picked up a duplexer at HRO and now am running 40 meters to 70cm through the ATAS-100 and it works great. The nice thing is you don't have to tune when you switch to VHF/UHF. This means that if you are working 40 meters you can just switch to VHF/UHF to hit a local repeater and then pop back on HF without waiting for the antenna to retract and extend. Nice feature!

If anyone has noticed this noise blanker bug please post your experience.

Thanks es 73

Duke, are you sure it doesn't receive above 450? Mine does. It appears to
have "another band" above 440 that would go to, say, 460.

Is it a US model?

I have an ATAS as well, I originally used it with my 847 mobile. I was under the impression that the ATAS was supposed to be completely retracted for operation on 2m/70cm Thereby completely occluding the coil into the 'mast.' Have you checked your SWR on 2m while the ant is tuned for 40m? If everything is ok, THANKS for the great tip!

73,
Mike

Hi Mike,

Oops, you may be right. I just went out and checked the SWR and it is one dash, line, unit, more on 2 meters with the antenna extended for 40 meters than it is with the antenna fully retracted but remained the same on 440. So... I guess I should thank you for a tip! By the way, is there a better way to fully retract the antenna than to go to 6 meters and hit tune? from 40 to 6 it seems to leave the rig in low power transmit for quite some time.

Also though the SWR is higher with the antenna fully extended it still does not seem overly high. I wish I knew what each of those dashes on the SWR meter meant, is it true reflected power in watts?

Now that you have a duplexer on, set the menu setting to ATAS-2 as per the manual, that will allow you to tune on 2m, 70cm. Unfortunately it doesn't actually tune the antenna though. It basically just does a FULL retract even if it was only barely out (like for 10m) Sooo, the PTT is locked out while it waits for about a minute or so. The 847 does the same thing, but its not as long a time period.

I wish I knew what each bar one meant too, I'll try to ask the Tech when I go down to Yaesu tomorrow morning. Anyone know how many 'bars' are supposed to be deflected in ALC mode? I must say, this is the worst Yaesu manual I've ever read (and I've got my fair share of Yaesu manuals.) Also, is there a detailed explanation of the scope function anywhere in the manual? If there is, I'm an idiot and can't find it.

73,
Mike

Mike,

Just ran back outside and tried hitting the tune button on 2m, 70cm in the ATAS-2 position and the button has no effect. When you first activate the ATAS-2 mode by hitting function the antenna fully retracts but from that point on when you go to either vhf or uhf the tune button is not functional and the antenna remains at the length it was when last used in HF mode. At least that's the way it is with my rig and antenna.

Hmm, now I'm trying to remember if I ever even tried to hitting the tune button after setting up the atas-2 mode. I can't remember one way or the other. I'd give it a try right now too, but its all packed up for its trip back to the shop. I'll try it as soon as I get it back though.

I fully agree Mike, and I have MUCH RESPECT for Pres and the others
that have contributed to the technical end of the spectrum for our list,
concerns, and our purpose... I've learned so much from you guys, I
can't thank you enough... So can we now get on to posting some mods for
the radio now that we've worked through this? (we had to work through
the bickering on this issue on the VX5R list also) Thanks guys, I'll
figure out a way to make it worth your while, I really appreciate it.
If you know of a mod, but don't want to post it, just email me private,
thanks. Because I really need to know of the capabilities of the rig,
because if it won't do what I need it to do, then I'll be lookin' at the
706 mkIIG instead (which I don't want to do being a Yaesu man).

Thanks,
Scott

Thanks Pres. I managed get it to receive up to 481 Mcs, then it goes dead. Wonder if the pass band filters take over there. I think I need the service manual when it is available and see if part of the uhf spectrum can be modified for the recieve part above 481Mcs to 869Mcs.

Thanks again,

Duke w9gdw

170. scope

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-05 12:33:15 UTC
From: reedjc@songs.sce.com
Topic: 170 Message: 170

Mike,

I've been doing some work with the scope and have found it to be very useable. First of all, it doesn't work for CW. But if you want to pin down a SSB signal, it works like this:

In the scope mode, you'll see a center mark that is blinking - that corresponds to your tuned frequency.

To the right, you'll see 8 shaded blocks and to the left you'll see 7 shaded blocks. Each block can be occupied by two signals.

Each block represents 5kc. So, if you see a signal that is up the band say, 6 blocks, then you know that its 30 kc above your frequency. The fastest way to get there is to use the select knob. Since the select knob shifts by 10 kc per click, 3 clicks in the clockwise direction will put you right on top of the signal. If its up by 1/2 a block, just use the tuning knob to shift by 2.5 kc. If its up by one full block, use the tuning knob again to get there - remember the select knob will shift you by 10!

With a little practice, you'll begin having fun with it. In fact, you'll be playing with the scope more than you'll be getting on the air! It's a kick.....try it!

171. ATAS-100 tuning for vhf/uhf

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-05 12:49:32 UTC
From: reedjc@songs.sce.com
Topic: 171 Message: 171

Hi guys,

I've the same experience when trying to tune for vhf and uhf. If I hit the tune button, nothing happens. I have to shift to an HF band and manually retract the antenna by hitting the PTT on the mike while pressing the down button on the rig until the antenna is fully retracted. Also, the down button on the mike seems to have no effect. Its kind of akward to key the mike and push the down button on the rig to retract the antenna, but its the only way that I've been able to do it.

It sure would be nice to be able to retract for VHF/UHF using an easier method. Anyone know of one? And yes, I agree - the antenna should be fully retracted for VHF/UHF operation. I think the manual says something like this: "for vhf and uhf operation, there is no tuning required, as long as the antenna is fully retracted.....".

From: Thomas M. Schaefer
Topic: 172 Message: 172

Just an update...My FT100 is on the way back. It was received by Yaesu on Monday, March 29th and shipped back on Friday, April 2. It looks like they replaced a transistor in the PA, "updated it", whatever that means...and aligned it again.

As soon as I get it, I am going to do the rubber-band test (9.5 minutes key down at 50 watts on VHF) to check it out again. I will let everyone know the results of my test.

They were not able to duplicate the squelch problem or the receiver images problem, so I think I will have to live with those, althought I understand some have found a way to duplicate it. If you know how to duplicate the receiver going dead until you stop the VFO know, please post the procedure here, so Yaesu can try and duplicate it.

Thanks,

Tom NY4I

Mike-
Your 20m description is typical of Yaesu HF rig behavior when high degree of RF is present in the (vicinity of) the radio. Typically a really bad match combined with poor ground.

Suggestion: (and story) First put the FT100 and ATAS in the car, and had great luck although some of the ATAS matches were a little fragile with occassional high VSWR warnings. Two days later, couldn't match at any frequency other than 6m (I'd moved the radio inside the car slightly, under one foot difference in location). Giving this some thought, I came to the conclusion that 1) the rig wasn't properly RF grounded or 2) the antenna wasn't working against a reasonable ground plane. Since 1 could cause 2, I started with that. I coupled the rig chassis to the frame of the vehicle with a 2 foot strip of flat 1" wide ground braid. Result? I can now match on all bands just fine, and usually in a much shorter time than when I first got the rig set up.

Subject: [FT100] Re: Dead FT-100 returned

From: "Michael Jones" <mjones@...>

Okay, here's the update I promised...

Well it seems they fixed the major problem, but I have a sinking feeling that its going to die again. When I first brought it in to Yaesu the tech immediatly noticed that it was drawing too much current which then led to the blown rf amp. Well, according to my power supply meter the poor little thing is drawing 26 amps on transmit. I'm surprised its not blowing the 25 amp fuses. And thats not SSB peaks either, thats a carrier on 2m 50 watts. My 847 and 8100r only draw appx 11 amps at 50 watts.

But, either way, it doesn't matter too much because they didn't fix my 20m problem. Kinda silly considering that the 20m problem existed right out of the box, at least the rest of the radio took about 18 hours to die.

So, the power problem is fixed, but 20m isn't. For those that weren't on the list then, on 20m as soon as I modulate a carrier the power output stays at peak output until the PTT is released. The reception of the signal on another rig sounds like solid FM whitenoise.

I talked to the customer service manager, John Lynn, (they were moving furniture, I expected to get his voice mail) I asked him if they could do a UPS pickup on the radio. He said, "no problem, call first thing monday morning and I'll arrange it." But, I think I'm just going to drive down again. I don't really want to make the 180 mile round trip again (especially with gas prices over $1.50 a gallon here now) but I think it'll save alot of time.

73 for now,
Mike

I was impressed with the difficulty of the installation
of the XF117C 500Hz filter. The manual for my radio included
a correction page which specified the correct location of the
filter (the front most slot is CWN or AMW filter).

The FTS27 is meant to stick on top of the cans to the left of
the filters. There should be no problem. I've installed numerous
FTS22 enc/dec modules and they usually occupy similar positions.
The decoder functions correctly. Still a puzzle why Yaesu doesn't
allow the memory to store separate encode and decode frequencies.

-Tom KB7EFZ
ps: the memory keyer is quite handy!

Just had my Graduate course in Neurosurgery !!
Actually, it wasn't that bad and it worked after I
buttoned it up. The manual doesn't jive with the
instructions on removing ribbon cables (only need
to remove 2) and the one connector (not mentioned).
However, the FTS-27 CTCSS Decoder just don't fit.
If I follow the manual outline I cover up some cans
with Dbl-Sided Tape that could be a problem. I think
I'll leave it out.
Otherwise, it works great, nice audio reports on SSB
and FM. "Yaesu Did It Again !!"

Topic: 154 Message: 178

To all those who asked about mods for the FT-100; When I talked to the technician supervisor where I bought my FT-100, he had asked about mods from Yaesu. They said at this point there were no mods yet, but when they did come out, they would let him know. Not even a mod to transmit on the low end of 70CM.(420 to 430Mcs)
The Yaesu tech did mention he might want proof of Mars license, or CAP etc. before the all the out of band transmit frequencies would be available. (that is if Yaesu can figure out how to implement them)
So far, mine is working great on all the amateur bands that are shown in the somewhat inadequate manual.
Oh yes, I did ask about a tech manual for the FT-100 also, and it is not available yet - at least where I bought mine. If anyone finds a source of this apparently rare book, please let the reflector know for those that might want to purchase one.

Why not? I have been using mine as a receiver for a week now, just haven't transmitted yet. I have a discone which works fine from AM through 6m, and I use a ducky on 2-440 to listen.

It is a fine, complex rig and the time you spend tooling around on the dining room table will be well spent before you are crouching in a car trying to figure out your new radio..

Scott,

If you have a 144/440 antenna that you have been using, I suggest that you just use it. I bought a duplexer and found that my diamond works better and is much easier. You have seen what you have to go through to get the antenna down. I find that it works better using a separate antenna for 144/440. I do like the Atas antenna, but you don't need a duplexer or an Atas antenna if you have a hamstick or another antenna. Your radio will work just fine with other mobile HF antenna's.

To answer your question if you are going to use the Atas for everything would be the Comet HF/UHF&VHF duplexer. It uses RG8U and is constructed well.

Hi Scott,

I Just picked up a Diamond MX-62M duplexer that seems to work fine. If you have a power supply and access to any antennas in your shack you should fire up the rig and start playing with it. It's too much fun to leave in the box! I assume you know but if not the rig will work fine with just a HF antenna (as long as you don't use vhf/uhf) or visa-versa.

185. Great Mobile Mount

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-06 12:57:10 UTC
From: 2K-plus
Topic: 185 Message: 185

I just did the permanent in-car installation of my FT-100 in my Jeep Grand Cherokee yesterday and found a great solution for the control head. I picked up a cell phone mount at the Car Phone Store, the kind that is a stick with a 4 hole mounting plate on each end and adjustable ball joints connecting the shaft to each mounting plate. I mounted one end on the transmission hump next to the between seat console and was able to adjust the ball joints so I can rest my arm on the console arm rest and comfortably tune the radio. It looks great with just the faceplate mounted up front and the holes in the mounting plate even matched perfectly with the holes in the YSK-100 face plate mount! I put the transceiver section in a cutout in the cargo space mounted vertically and all seems to work fine with plenty of cooling for the rig. The Cell phone mounts come in many different lengths and adjustment configurations and are reactively inexpensive. Mine was a whole $12 for an all anodized metal mount.

Richard,

Back when I had my Grand Cherokee (a '93), I had my TM-741a tribander mounted back there. I cut a hole in the top of the recessed section and ran my coax, power, audio and remote cables through it. I put a piece of 1/8" aluminum on the back side as a stiffner for the mobile brack. I then cut out a piece of black Plexiglas to the shape of the recessed area. I used a router and cut some angled slots into it, then mounted a fan on the inside. I used a couple of small screws around the perimeter to attach it to the lip in the recessed area.

This made the radio totally invisible, and the fan provided more than adequate cooling (in fact, better cooling, since the body of the radio now had airflow across it.

I had thought about trying to color match it to the plastic used inside the vehicle, but decided that was too much trouble. When I went to have a car stereo installed the installer was asking who had done the work, and that it was better than most of the stuff their installers did (except his, *of course*). I told him I had done it, and it had taken me about 5 hours. He was pretty impressed and showed it off to the other folks. They copped my idea for hiding an audio amp back there.

Congrats on the FT-100. That's my next HF radio, as soon as I get done putting the super-charger on my '98 Durango 5.9L.

Hi Chris,

Great idea about the black Plexiglas! That was the only part of the installation I wasn't that happy with. The fact that in strong light you could see the rig from outside through the tinted windows and the ability of my Newfoundland dog, who gets transported in the back to slobber on the rig.

Thanks es 73

Richard / N1VXW

Tell me why it would be important to transmit in an area where we do not have privileges? The radio will receive in the telephone area but will not transmit in that area nor should you even try.

May I suggest that the group not be so concerned with how to make this radio TX in areas that are not legal, and focus on how to make this radio work better in the areas that we are allowed to operate. If this is going to be a group where we find out how to make these into CB radios ect.. then it has lost it's interest with me.

Well thank you for informing me on the legal and ethical uses of the
radio. I am glad that we have people in the world who are still overly
concerned with how others use their equipment.
I am well aware as to what I am "Legally" allowed to do!
As you may or may not know the radio may be used as a small repeater, I
would like to put that function to a more creative use and extend the range
of my cordless phone. considering I own approximately 500 acres of land I
am sure I can decrease the transmit power as to not interfere with anyone in
the area! Nearest house 2.5 miles.
Unless you work for the FCC enforcement unit, I would recommend you
leaving that up to the professionals.

I would suggest that you use this list to derive helpful and useful
information that helps you in all of your endeavors and allow everyone else
to do the same. If/When I find out how to modify these radios whether it be
MARS/CAP or CB or CORDLESS PHONES or CELL PHONES, I am going to share it
with everyone on the list. If you decide to use these mods then good for
you!

I hope that answers your question.

I agree and disagree on the mods issue. I am a casual DF'er
and having a radio that *receives* out of band can be important for
DF'ing, interference scanning, repeater intermod location, etc.

As far as transmitting, I'm content to not transmit out of
band. I'd like to have the radio modded for it, though, and here's
why: If I'm ever in a situation to provide emergency support and
transmitting out of band means saving a life or property, I have *no*
qualms about that.

Of course, I consider myself a responsible radio operator, and
normally never have occasion to do it. And I know there are a number
of "high-banders" or "pirates" that don't mind acting irresponsibly
(K1MAN comes to mind!), and these people sure as heck don't need any
mods for *their* radios.

Hi Tom,

Standard practice for mobile mounting especially at HF freqs is to have a good solid short ground from the radio to the vehicle frame. The ground on the coax or the power return does not mean squat at rf. And usually goes to a point that may be a good battery ground but a poor rf ground. Just about all HF mounting practices involve not only grounding the rig directly to the body of the car but to bond various body parts with with copper braids (bumpers, tail pipe, engine, etc.). The problems may not show up at vhf or uhf frequencies because the roof of the car provides an adequate ground plane. At HF the car body is used to capacitively couple the radio to earth ground and provides a plethora of opportunity to get un-wanted rf fed back into the radio.

Is Yaesu still using those "easy to loose or strip" screws for
affixing the separation cable to the remote head and main unit similar
to my FT-900 and 8100R?

Then you also know that hams are considered to be at least in part self policing. Therefore it is the duty of a licensed amateur to point out a problem to another fellow amateur that may result in violation of any FCC regulation. If anything they are only trying to prevent you from a possible fine and loss of equipment and license. Hams have always been looked on as the guys with white hats....

There are a lot less expensive ways to do that legally. There are several types of radio services that will let you have a telephone interconnect. You can pick up used and new radios for very reasonable prices these days. I would bet you could set up a system for less than half of what you spent on the FT-100 that would out perform the FT-100 for what you want.

> Unless you work for the FCC enforcement unit, I would recommend you
> leaving that up to the professionals.

Once again Robert, as licensed amateurs we are obligated to self police. We are the only radio service to do so. We are also the only radio service that can build or modify our equipment and are left to our engineering skills to determine that we are not in violation of any regulations when it comes to power output, frequency, spurious radiation or harmonic radiation. All other services are limited to type accepted radios that may only be serviced by licensed personal or those under the direct supervision of the same.

Every time one of our ranks purposes to abuse the privilege by using his radio outside of what is allowable by FCC regulations, it puts us all in jeopardy of loosing what privileges we have.

> I would suggest that you use this list to derive helpful and useful
> information that helps you in all of your endeavors and allow everyone else
> to do the same. If/When I find out how to modify these radios whether it be
> MARS/CAP or CB or CORDLESS PHONES or CELL PHONES, I am going to share it

> with everyone on the list. If you decide to use these mods then good for
> you!

On a technical basis I really don't have any problem with knowing as much as possible about a radio I may have or want to have. Such information has valid use for things like MARS or CAP or maybe even getting the radio to work legally on the 220 meter ham band. These things are all within the regulations. And there is nothing that I know of in the regulations that state that your transmitter must not be able to transmit outside of the band edge only that you shall not do so. With your license you are given the trust and responsibility not to do so.

Robert, I will gladly help you come up with a method to set up your 500 acre place for a radio / telephone interface. However I will not jeprodise my amateur license just sitting by quietly while you purpose to use your privileges in a illegal manner that reflects not only on you but all of us.

Hi James,

I apologize for responding to Robert. I did not read this message until I had done so.

However I do feel as self policing hams we need to inform those who would violate the law. We are required to so so under the grant of our license. The problem with Robert's post was that he did not just say he wanted to know what the mods were but said he actually wanted to use the radio outside of the ham bands. In my mind there is a big difference between the first and second. The second could effect us all.

200. 2nd Repair of Dead FT-100 Update + misc info

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-06 20:24:27 UTC
From: Michael Jones (KF6SWI)
Topic: 200 Message: 200

Well all, good news! My FT-100 is back in full operating condition. I drove it down to Yaesu Monday morning and they repaired it while I waited (actually I was right there with the Tech the whole time) The Tech was really a great guy, there was fairly heavy language barrier, but we did the best we could to communicate and with the bond of ham radio and its terminology we did just fine.

One of my concerns about the radio was that it was drawing current in the 20+ amp range during transmit on 2/70cm. As bizzare as it may sound this is absolutely normal on the FT-100. Basically, the FT-100 only uses one set of finals for both 2 and 70 instead of the more customary two. Hence the PA is VERY broadbanded and VERY inneficiant. That got me concerned about heat dissipation, but he assured me that the rig can get rid of the heat properly. Essentially the entire chasis of the radio is a giant heatsink. It'll be curious to see if ICOM takes this same approach with their new IC706 Mk II G.

Before he tackled the 20m transmission problem he decided to do a purity check on all the HF bands starting at 160m. As soon as he keyed up the out-of-band icon came up and inhibited transmit. Uh-Oh, I'd never even tried 160. He moved up to 80m and the same thing happend. I'd never tried 80m either. He moved up to 40 and everything was A-Ok. He was REALLY concerned about that.

Apparantly there is a rogue software program out on the net somewhere that people are using to program their rig settings (I'm surprised we haven't heard about it on this list.) Evidently, this software on occasion is causing damage to the bandplans. I assured him that I'd never hooked the radio to my computer and that I hadn't even tried out the CAT yet. Then he got REALLY REALLY concerned.

He started digging through the notebook that will eventually become the service manual for further info. Then I thought of a possible solution; the radio was in ATAS-1 mode (menu 61) We turned that off and everything worked perfectly. I consider this a very nice feature, the radio knows that the ATAS-100 is not anywhere near capable of operating on 160/80/75 so it prevents you from even trying.

Okay, he started running his purity tests and noted some interesting things about the speech processor. If the processor is set below about 25 it actually starts to decrease the average power output. At the other end, above about 75 the DSP equivalent of clipping starts to occur. We found that 40 was the optimum setting for my voice which is higher in pitch then average.

When testing 20m he noticed that the signal was not as clear as the other bands, but it was acceptable. This baffled me completely because previously my transmissions were completely unreadable (they sounded like FM white noise) Sooo, he wanted to test it out in my car. Bingo, the problem showed up more then it did on the bench, but not anywhere near as bad as it had been. We brought it back inside and he opened it up and adjust what I think was a small variable resistor (I may be completely off base) That completely cleard it up on the bench and in my car it became like it was on the bench. Definite improvement.

With the help of another list member it was pointed out to me that Yaesus have something of a reputation for having problems on 20m in an high RFI environment and that moving the location of the radio can have dramatic effect. I didn't get this info until AFTER I returned from Yaesu. So I started to worry. We had tested the rig in my vechicle by simply setting it on the passenger seat. What's going to happen when I get it remounted? Well, I decided that I'm not going to remount it under the dash, my separation kit will be here Thursday, so I'm going to mount it under the passenger seat. I figure thats the closest I can get to where it was working properly. Good decision, bad decision?

I spent a total of about 45 minutes at Yaesu and drove home VERY happy. Hopefully I'll get everything installed Saturday morning.

73 for now,
Mike

204. Antenna(s)

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-06 22:49:26 UTC
From: Richard W. Solomon
Topic: 204 Message: 204

I have read several notes about antennas and thought I would pass on what we use. I have the Hustler Mobile antenna with 20/17/15/12 Meter coils on the top. Instant bandswitching, no waiting. The VHF/UHF output goes to a duo-band window antenna. So I can go from 20 meters to 70 cm with just the rotation of the switch. And for 6 meters, I found the Hustler HF antenna works fine (4 watts refl.), the mast seems to be a 1/4 wave. Now to fill up those 300 memories !!

Mark, I am absolutely not disagreeing with you. However, I got fabulous results recently on 15m at least with virtually no grounding whatsoever! I had a ham-stick helically wound stick with whip on top, clamped to a spare tire carrier on the back of a Kia Sportage. You can't tell what's gonna work.

But in general, you are right.

In view of the myriad of electronics involved in cars (I once ruined a Jaguar main wiring harness while installing a mobile phone in about a second flat, $700 later it was fixed... ZOW!) I would suggest having the dealer do all the bonding you suggest. I would think the job could be done in half an hour, and $40 would be cheap insurance against damage to your car.

Well, do you mean that on 2m there is one amp as opposed to 2 stages, and
450 one amp as opposed to 2 stages, or do you mean 1 amplifier section
working on both 2 and 440?

Because what I'm wondering is if there might be any performance on 220
when...er...mod'ed!

The VX-5 camp reports decent 220 reception which goes bad in the lower
300's- has anyone tried the FT-100 at least receiving on 220?

I agree with you, I have jury rigged up units that did not have one bit of a problem. But, when there is a RF problem the first place to start is to assure that you have the best grounding possible. This also goes for fixed stations as well.

>
> In view of the myriad of electronics involved in cars (I once ruined a

Ouch!!! When I used to work in the mobile radio business I saw that happen a couple of times. Real bad news when the customer comes back to get his new car with his new commercial radio or phone installation only to find the fire department pulling what is left out of the install bay......

On a safety note when folks do their install be sure that you have both battery leads fused. This was not always done in the past until the first time the regular ground return lead for the car became disconnected and when the car was started all of the starter current found it's way back to ground though the negative power lead to the radio and back down the coax shield. Talk about smoking coax..... (Hi Hi)

Great idea! Are the dealers radio aware now? Do they know of all the grounding points? I will probably take your advise and let them do it on my Explorer. Is there anything that one should tell the dealer when you request this to avoid those strange looks.....

>this to avoid those strange looks.....

Oh, you'll get lotsa blank stares. But if your area is like ours, there are Ford dealers every 2.3 miles. Drop by and interview the technicians... maybe at coffee break time. Ask them a few questions, dropping terms like EEC and SBDS. If they know what these are (Electronic Engine Controls and Service Bay Diagnostic Systems) you have a shot at talking to someone who understands enough electronics to avoid saying things like "that has a 10 volt draw" or the like.

By the way, I'd like to remind the list that Fords are known to have noisy fuel pumps, and we sell a white plastic potted filter that is intended to go INSIDE the fuel tank, but I have found they work dandy across the power leads of the radio. I would be pleased to supply list members with this thingy. Gosh, I hope it is still available! I have one permanently attached to my Kenwood.

The way to tell if you have this effect is to listen on AM-Aircraft with the power connected continuously, and turn the key to the RUN position, not all the way to crank. You will hear a 2 second buzz-whine that corresponds to the fuel pump being shot on briefly (you can also hear it mechanically) then it quits, but it returns when the vehicle is running. The hash is quite strong in the Aircraft band and sounds like hashy alternator whine. That filter I mentioned did the trick on my Kenwood TM-741.

As I understand it and I *CERTAINLY may be wrong* 1 amplifier for both 2m and 70cm in one unit. Sooo I'm going to go out on a limb and do some logical follow through. If the amplifier is an inneficiant module broadbanded from say 140MHz to 480MHz that would put the point of highest efficiency at appx 310MHz. But, I would say thats definately NOT the center frequency because the power out on 2m is 50 watts and the power on 70cm is 20 watts.

So, lets get a little more theoretical...but keep in mind I'm just thinking out loud here not doing the actual math. 'Standard' amateur power amplifiers rate roughly 120 watts at 22 amps of current draw at their peak efficient frequency. In my head I'm trying to plot a curve which would intersect 50 watts out at 144 and 20 watts out at 440. I'm guesstimating that the 'center frequuency' might fall somewhere near the 220 band.

If that's the case and the radio will properly transmit there AND with some serious power output, why isn't it open? Because the receive circuitry is all but nonexistent there? Because most countries don't have that band? Because in many countries its a Law Enforcement band? Because Novice class licensees are limited to 25 watts on this band? Because it'll cause thermonuclear meltdown? Beacause it might snow in the Sahara Desert in June?

Press,

This is antidotal information only. I was using an outbacker with a trailer hitch mount on my jeep before I switched to the ATAS-100 which is mounted on a 3 pad magmount on the roof. There is a major difference with the ATAS-100 (both in receive and transmit signal reports) but I truly don't know how much getting the antenna up on the roof and it's additional height, distance from the back metal hatch and ground plane of the large roof would have improved the performance of the outbacker. Of course climbing up on the roof to change the taps on the outbacker might have been a hassle.

I know that it is a little rough to see this as a comparison but The Yaesu VX5 Has one single PA for 6/2/70cm. Quite brodbanded. It seems very efficient requiring only 7.2 volts for full power 5 watts out on 6 and 2 meters but only 4.5 watts on 70 cm. Notice the loss of efficiency at 70cm? My point is that these companies likt Yaesu can reduce costs by reducing parts, especially parts like PA's, so it follows that the FT100 will have as few PA's as possible taking advantage of the very Bordbanded nature of what seems to be new technology.
Does any of this really make any sense?

214. Rubber-band test

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-07 15:21:46 UTC
From: Thomas M. Schaefer
Topic: 214 Message: 214

Well, the radio has passed the rubber band test on 2m. I kept it key down for 15 minutes last night at 50 watts. Towards the end, I noticed the SWR symbol coming on so something did not like key down that long. One observation..Even after 15 minutes of keydown, the radio was barely warn except right by the fan. My radio used to get very hot, but now it does not. So, things are looking good.

215. Strange receiver squelch problem explained...

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-07 15:28:58 UTC
From: Thomas M. Schaefer
Topic: 215 Message: 215

Some of you may remember a while back I had a problem where I would tune the radio and the receiver would stop receiving (except for little pops). It would only receive normally when I stopped tuning the VFO. Here is how to duplicate the problem...

1. Put the radio on some HF band (20m works)
2. Open the squelch all the way -- full counter-clockwise
3. Press and hold the DOWN key on the microphone to start scan mode (The SCN icon will appear)
4. Let go of the DOWN key -- The radio will stop scanning because the squelch is open
5. Turn the VFO knob for a bit and your receiver should stop receiving
6. Stop the VFO and it will come back
7. Press PTT quickly to stop scan mode

The problem is that I was putting the radio into scan mode by using the up/down button (easier than reaching down to the VFO).

Yaesu -- My recommended solution is that if the VFO know is manually moved, take the radio out of scan mode as well. Additionally, a selectable feature where the UP/DOWN buttons on the MIC do not activate scan mode would be good too.

In the meantime, if you get into this problem, press PTT quickly.

So, the only thing I have remaining (And I only hit it once) is the receiver image problem, but that is not really an issue right now.

216. Can Anyone Duplicate This Bug

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-07 15:45:28 UTC
From: 2K-plus
Topic: 216 Message: 216

I posted a few days ago about a noise blanker bug I was experiencing. Here is what happens on my rig to make it occur (all this is done in the vehicle with motor running). Tune radio to 40 meters hopefully when it is a bit noisy. Set the noise blanker to 10 and turn the noise blanker function on with radio in LSB mode. Turn radio off and then back on. I experience a large reduction in S meter deflection and audio output. if I hit the PTT switch the radio becomes normal again. Also if I turn the rig off than on with the noise blanker disengaged the problem doesn't show up. I would be very interested if anyone else is experiencing this bug.

thanks,

Richard / N1VXW

Hi John,

Mine had room under the back seat but on the driver side the power amp for the stereo system resides and I was worried about RFI (my 2/440 HT sometimes got into the stereo). On the passenger seat it was kind of a small space with the seat sealing up the enclosure and I was worried about heat build up thus the decision to mount in the back.

221. Re: Antenna(s)

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-07 21:02:29 UTC
From: Walsh, Tom
Topic: 204 Message: 221

Note that the ability to go quickly from 20 meters to 12 meters
is a more relevant, since use of a dual band VHF/UHF mag mount
for 2m / 70cm provides instant "local / dx" switch with FT-100
and ATAS-100.

Some of these notes seem to be based on the idea that the ATAS
takes significant time to tune. Note that in a station with a
rudimentary ground, ATAS-100 tuning time is approximately five
seconds when I switch bands. Only if the radio is completely
unable to find a match in the 'expected' direction does it take
a relatively long time (and that's a radio program issue, since
the ATAS can fully retract much faster than the radio thinks it
can.)

I have read several notes about antennas and thought I would
pass on what we use. I have the Hustler Mobile antenna with
20/17/15/12 Meter coils on the top. Instant bandswitching, no
waiting. The VHF/UHF output goes to a duo-band window
antenna. So I can go from 20 meters to 70 cm with just the
rotation of the switch. And for 6 meters, I found the Hustler
HF antenna works fine (4 watts refl.), the mast seems to be
a 1/4 wave. Now to fill up those 300 memories !!

From: Tom Clements
Topic: 222 Message: 222

I'm interested in using the FT-100 for Pactor II, PSK, etc. and wonder if anyone knows if there is a themally stabile crystal (or other tuning scheme) offered for the FT-100 as there is for the ICOM 706. Also, how about a 500 Hz. (or 300 Hz) filter.

I'd like to use the SGC-230 antenna tuner with the FT-100 with a marine whip. The 230 requires 10 watts output for tuning. Will the FT-100 put out 10 watts into a high SWR environment without shutting down?

Many thanks for your help,

Tom, W1ICH

Greetings everyone...

I've been lurking here and enjoying the comments posted to the reflector. I'm considering purchase of the FT-100 (to complement an FT-847 in the shack! Hi). Anyone have feedback on whether a '98 Honda Civic's electrical system could handle the 20amp draw? The car has power windows & A/C, so I believe the alternator has sufficient current production. A few years back, I occasionally ran HF using an FT-890 in an Acura Integra without any ill effects.

Any feedback or experiences would be appreciated. However, I don't want to waste too much bandwidth on here, so private email is fine too!

225. Tuning the ATAS-100 on 2mtr/70cm

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-08 04:05:22 UTC
From: REEDJC@SONGS.SCE.COM
Topic: 225 Message: 225

If you enter the menu and change the antenna
configuration from atas-2 (like the manual tells
you to do when using an ATAS-100 with a duplexer)
to atas-1, the antenna will drive all the way down
to fully retracted in the 2 mtr/70cm mode when the tune button is depressed - without having to press the 'down' button while
simultaneously pushing the PTT switch on the mike.

The manual also says that the rig isn't built to
auto tune on the warc bands but that you can tune
it manually. I've found that mine auto tunes on
the warc bands as easily as it does on 6,10,15,20,
or 40.

If you select the tune button while selected to
2mtr or 70 cm, the antenna will drive to the fully
retracted position and stop after 60 seconds. It is then ready for 2mtr/70cm operation. If you don't want to wait a full minute for it to stop, you can stop it from driving by pushing the tune button again. I've found that from 40 mtr to fully retracted takes no longer than 35 seconds. So, if
I want to work 2 mtr band, I'll select it, hit the
tune button and stop it after about 35 seconds.

Of course, it still takes a while for it to drive
down, but at least you don't have to drive it down manually - makes driving the car a lot safer!

226. Worked RS-12 Satellite With FT-100 & ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-08 13:30:00 UTC
From: 2K-plus
Topic: 226 Message: 226

This rig / antenna combination is just too cool. I just worked W8TRX on the RS-12 Satellite from the car with the uplink on 2 meters and the Downlink on ten meters. The 2 meter SWR with the antenna set for 29.480 was very low so that wasn't a problem and I received a 57 signal report an my uplink signal. The bird was passing over at 77 degrees so it wasn't a real long shot but it sure impressed the heck out of me.

Go out and give it a try! AO-27 is coming over at 11:31 so I'll have to see if it will work a 2m/70cm FM satellite.

73 es have fun.

Ray! Welcome! Having already done what you propose to do (complement the FT847), my only warning is that you'll probably be less satisfied with your FT847 after using the FT100....

If you are running to the battery (I ran four 10 gauge wires, two VCC, two ground) you should not have any problem. I used to run my FT747 mobile in my Honda CRX-Si. The lack of any decent noise suppression in the radio put an end to that, but it was fun while it lasted. Speaking from that background, and having run the FT847 mobile, I highly recommend getting the FT100. Of course, if you can wait a bit, you will probably get a much better price :-)

No...To use the ATAS or any other antenna like it you need a diplexer.

YES BUT !!!! What I've found is.... that the ATAS-100 antenna, when retracted down all the way, has a HIGHER SWR on 2-meters at fully retracted than it does in a couple other positions "partially extended" than fully retracted. It varies in frequency however, you have to test a few different freqs within 2-meters, because some of the freqs in 2-meters are just fine at fully retracted, but others are around 3.5:1 or higher, which is unsatisfactory in my book. (70cm seems to work fine at fully retracted, but 2-meters doesn't) Anyway, I WISH LIKE HELL that Yaesu wouldn't have DISABLED the manual-tune of the ATAS-100 on 2m/70cm, because if it was possible to manually tune the antenna on those bands, we could acheive much better SWR results than what's attainable at fully retracted. I ran experiments all day long yesterday with an SWR meter and compared it's results to the built-in SWR meter (so I could mentally assign actual numbers to the "bars" on the built-in meter on the FT100) and I would manually tune the antenna while on 6m band, and then switched back to 2-meters and did the SWR tests that way to come up with the results.

I voiced my concern about the disabled manual-tune function on 2m/70cm to YAESU California yesterday, and he said he's going to bring up the issue to the STAFF today in a meeting because this YAESU tech agreed totally with me on the issue, and believed that this should be updated.

Am I missing something? The ATAS was clearly intended as an HF antenna. You'll likely get far better results by running a simple mag mount like the larsen 2/70's for 2m and 440, and you'll save money to boot by not buying a (di?)plexer.

The reason tuning is disabled on 2/70 is that the PA can operate into the antenna with the retracted vswr, if one is insistent that the HF antenna must double as a VHF/UHF antenna.

Your "low" vswr points are simply interesting impedance transforms provided by the length of the antenna and the length of the cables, related to the operating frequency.

Some call this "transformer action", I think.

I run the ATAS and an NMO 2/70 mag mount. Works great. Instant switching from one HF/6 band to either 2m or 440.

Great! Well I seem to have my first glitch.

I have been using it only to receive, without the mic or anything else like a key or anything plugged in. Last night I noticed if it is in the CW mode a continuous tone comes out reminding me of sidetone or even a keypress beep, which has been disabled. I don't think it is trying to transmit (I hear the background noise mixed with it). Any ideas?

Is your battery low? I have noticed that running the rig without the car started can cause; a continuous tone, flickering of the display in xmit and erratic tuning of the antenna. I haven't checked my battery which is 2 years old but never has problems starting but it seems the rig may be a bit finicky about seeing 13.5+ VDC.

I ran mine on 6m USB and FM last night down to 11.5 VDC
in the car with the engine off (oh well). It behaved
perfectly.

Naturally, any CW source nearby could be radiating into
the rig and the BFO in CW mode would cause it to make a
tone...

Hello Ft100er's

Would one of you that has this new rig find out for me, or measure, the amperage used when the rig is in the recieve mode--squelch open or closed (or both ways).

I have used the IC706 portable, powered by batteries at remote hiking spots, for quite a long time. The 706 uses up power very quickly. On recieve only, with the squelch closed and the display lighting turned down,
it still uses 1.6 AMPS!! This compares to an FT290R II which uses somewhere in the neighborhood of only 100-200 ma.

I'd like to buy an Ft 100, but wonder if the draw will be less than the 706. The spec may be available in the manual but I haven't seen it anywhere
on the Yaesu site.
Thanks for the help.

Yes, but it distinctively sounded like a microprocessor-generated tone, like
a warning. Also on many freqs and bands.

Naturally, it stopped, so I can't duplicate it!

My question: Would you share how you attached the braid to on the FT-100 chassis? There's no ground lug on the rear panel -- other than the screws holding the antenna pigtails. Or did you use the holes for the mounting bracket?

Second question, for the list: Is it also necessary to ground the ATAS-100 for satisfactory results? I've seen a number of people on the list are using a magnetic mount with success, which is encouraging. I've already purchased a three-magnet mount (with the SO-239 connector) from Lakeview (the Hamstick people). I note that Richard, N1VXW <twoKplus@...> is also using a three-magnet mount on the roof of his Jeep, so I presume it is strong enough to hold it. But I wonder if a trunk lid mount (such as the Diamond K400, which is recommended in the ATAS-100 instructions) would do a better job.

Third question: Is there a dual-band 2m/70cm antenna anyone would particularly like to recommend? (I think I've managed to convince my wife that a second antenna is desirable, and won't look "trashy".)

Thanks. It's great getting info from the other pioneers. I'm looking forward to putting my rig into service (still waiting for the separation kit; then I'll have to figure out how to get the DC cable through the Saturn's firewall -- are other people cutting the DC connector off, feeding the cables through, and then reattaching it?).

246. Anybody tried mounting the control head to an overhead console?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-11 02:52:09 UTC
From: Ron Mozer
Topic: 246 Message: 246

I've been using my FT100 setting on the dash of a minivan with an ATAS100 on a quad mag mount on the roof with excellent results. A week long trip from New Mexico to California was a lot of fun working HF, VHF, and UHF all along the way - what a neat radio.

I had to cover the unit with a custom made quilt provided by my xyl (kb5sbv) to keep it out of the direct sunlight and from being too obvious. Well I now have the remote kit and want to move the radio to under the drivers seat and mount the control head on some sort of small overhead console between the sun visors. I could then put the microphone on the lower dash (great to have it separate from the control head). I've been looking for a small overhead console that would be just big enough to hold the control head but have not found one so far. If anybody has any ideas I would love to hear them.

I could just mount the control head to the head board with a couple of "L" brackets... not as pretty but small enough to be out of the normal view from passers by!

Russ....I just cut the power cable about a foot from the fuse box and spliced in 4 feet of #10 stranded wire. This enabled me to feed the power cable between the hood/door junction and through a grommet in the space near the hinge. I threaded it through and then soldered the other end on. It works fine. The coax from the ATAS100 in fed through a hole I drilled in the end of the trunk and through the back seat, und over the hump. The saturn doesnt have a transmission hump, I don't think, because it is front wheel drive. Good luck...Dale KC2PZ

248. FT-100 frequency expansion from a little birdy

James,
I have also sent you a private e-mail, if we can talk that way, I
have one more question. Is that o.k.?

JJ

253. FT-100 fan noise

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-11 03:05:00 UTC
From: N0ISV@aol.com
Topic: 253 Message: 253

DE Wayne-N0ISV, and I am new to the 1 onelist!

I am 2 weeks into my new Yaesu FT-100.
What a neat rig, and alot ot learn.
As with most of us, I have some questions about the bugs.

When the FT-100 has been off all night or for a few hours, and at the first couple key ups, the fan (s) make alot of noise. This goes away with in a minute or so.
It will do this on any band at any power setting!

Any one else have this problem? Any ideas on what to do?

73-N0ISV

From: reedjc@songs.sce.com
Topic: 255 Message: 255

Hi folks,

It's a great little DX rig! I've found out that DX stations will come back to a mobile station before a base. Makes DX'ing a lot of fun.

From Oceanside California, I've worked Dublin City, Ireland and an operator in East Malaysia in the last day. And those contacts were during pileups!

Topic: 257 Message: 257

I've been looking for a small overhead console that would be just big enough to hold the control head but have not found one so far. If anybody has any ideas I would love to hear them.

I could just mount the control head to the head board with a couple of "L" brackets... not as pretty but small enough to be out of the normal view from passers by!

I haven't tried the remote kit for the 100 yet, but the control head looks similar in size to the Kenwood TM-741. Its bracket is a hinged looking thing where the angle is continuously vaiable. I took Radio Shack super velcro and stuck it to the top edge of the windshield. The head then tucks under the edge between the window and the headliner. Looks great, and invisible to the passers-by because it is behind the dark tint used to stop the sunlight. And the head is above the field of view, but easy to glance at when driving. It works out fabulously.

I hope Yeasu's mount for the FT-100 head is similar.

The ground point is any of the four mounting bracket point. I might also add that I recomend to go between the bracket and rig if you use the stock coated screws.

> Second question, for the list: Is it also necessary to ground the
ATAS-100
> for satisfactory results? I've seen a number of people on the list are

it

I hate to mention this after the fact, but the lakeview so-239 mount is a piece of junk. After about the third time you go to unscrew your ATAS the whole assembly will come apart, as soon as it starts to spin it'll break the coax solder joints. From that point on its a crapshoot wether or not the center of the coax is directly touching the center pin on the 239.

I'd recomend removing the 2 sheet metal screws that hold it on and replacing it with a Comet assembly. Or alternatively, you might be able to save it if you are careful. When you get it, take a good look from the bottom side and see if you can determine where on the 'barrel' portion that the flatspot is. If so, drill a hole through the side and put in a set screw. That will solve the problem of it unscrewing on you.

Unfortunately, I don't have any suggestion about the entire assembly being held on by two puny screws.

I deeply apologize to the list, I've been meaning to mention this for some time, I've just been to darn busy lately.

73,
Mike

Here is an idea I have used with my 706. Fabricate a bracket from plastic material or metal. The bracket is "L" shaped with an extra "L" that forms a pocket with the foot of the first "L". This pocket slips over the sun visor and the other half of the "L" hangs down from the visor to mount the radio head. This give you a very neat heads-up display. Even when you are looking at the radio you are looking straight ahead.

The construction is rather difficult to envision without a picture, so I will attempt a basic drawing "in character mode" below. If that does not work and there is enough interest I will do a drawing an attach it to a message.

```
-------------------------
Sun Visor |
-------------------------|
R |
A |
D |
I |
O |
```

I have used this approach for a couple of years and it works great.

Subject: [FT100] Anybody tried mounting the control head to an overhead console?

I've been using my FT100 setting on the dash of a minivan with an ATAS100 on a quad mag mount on the roof with excellent results. A week long trip from New Mexico to California was a lot of fun working HF, VHF, and UHF all along the way - what a neat radio.

I had to cover the unit with a custom made quilt provided by my xyl (kb5sbv) to keep it out of the direct sunlight and from being too obvious. Well I now have the remote kit and want to move the radio to under the drivers seat and mount the control head on some sort of small overhead console between the sun visors. I could then put the microphone on the lower dash (great to have it separate from the control head). I've been looking for a small overhead console that would be just big enough to hold the control head but have not found one so far. If anybody has any ideas I would love to hear them.

I could just mount the control head to the head board with a couple of "L" brackets... not as pretty but small enough to be out of the normal view from passers by!

That's OK, Mike; better late than never. Hmm... I think I see what you mean. Maybe it would be OK as long as you never tried to unscrew the antenna from the mount ... or maybe it's not worth taking the chance.

Before I spring for one, has anyone had experience with the Diamond K400 mount? In particular (and to make things interesting): I park at work in a garage with a very low clearance -- my existing 5/8-wave 2m whip bangs on the overhead pipes, and the ATAS-100 is a little taller than it. I'd be prepared to take along the Allen wrench and disconnect the whip before parking, but that seems a little inconvienient. However, the Diamond mount is supposed to have two axes of adjustment, so I wonder if it would be possible to mount the ATAS-100 at an angle so that it would clear the overhead obstructions. (I'm not sure how much of an angle would be required, but hopefully no more than 30 degrees.) Any comments on the chances for success of this plan?

Thanks & 73,

Ron...I considered mounting the control head between the visors and above the rear-view mirror, but the face was to far away to read the menus for me, with bifocals. I think I have a place that allows reading and also the ability to comfortably tune the big knob while driving. I have made a bracket out of aluminum that mounts in the bottom of my Lincoln's console bin. The bracket goes across the bottom, up the front side and out under the gap between the bin and the fold-down top. It then goes up about three inches at a 45 degree angle to move forward enough to feel comfortable. The only downside is that my cup holder is covered up. Dale KC2PZ

Russ,

I am using the Diamond K400 mount with the ATAS-100. I too park in a garage at work with a very low clearance. My solution has been to unscrew the antenna from the mount and storing it in my trunk before entering the garage. Not only does this eliminate the interference issue, it also protects the antenna from vandalism or theft. The best part is that it does not require any tools. I have been using this method for the past 2 weeks with no problems. Just make sure you install the protective cap on the diamond mount when the antenna is not installed.

I do not recommend you mounting the antenna on an angle as this will cause more mechanical stress on the mount and your trunk lid. Besides, it will look strange.

Hi Wayne,

I noticed the same thing. The fan didn't make any unusual startup noise till mounted it in my vehicle and now on cold mornings it is quite noisy for the first few transmissions till it warms up. I have put it under the category of "I guess I'll live with it unless it gets worse or I have to send the rig in for some other reason".

268. Dual Band Antenna

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-11 15:25:27 UTC
From: Ray
Topic: 268 Message: 268

Russ asked:

Third question: Is there a dual-band 2m/70cm antenna anyone would particularly like to recommend? (I think I've managed to convince my wife that a second antenna is desirable, and won't look "trashy".)

Russ, I'd highly recommend the Diamond NR73BNMO dual-bander. It's 1/2 wave on 2m with 2.15db gain and 5/8 wave on 440 with 5.3db gain. It will handle 100 watts. It's only 33" tall, and doesn't require grounding.

I can testify that after 5 Ohio winters, with salt de-iced roads, the flat-black finish, NMO mount, and gold contact pin are in perfect shape. I think your wife would find it esthetically pleasing also -- it could pass as a long cellular antenna.

Hope this helps.

I'm considering purchase of an FT-100 and I'm curious as to its scanning capabilities. Will it allow the memory channels to be assigned to banks similar to a conventional scanner? Is so, how many banks? Does it have a priority feature? And finally, what is the scan speed?

Thanks,
Steve Veal, N5SKH

Have you looked at the MFJ-345 with a MSRP of $34.95? Looks very similar to the Diamond K400. I got the MFJ model and have it on the trunk lip of a '92 Bonneville. The vehicle trunk slopes downward to the outside and rearward edges. It does have the capability to compensate for some opposing angles - got my 5/8 in a vertical position. I can not comment on its applicability regarding the Atlas-100 though.

A friend of mine W6WAT, is going to mount his ft100 head on his rearview mirror. (Pick-up w\ campershell) But it occured to me that one find various rearview mirror designs in junkyard CHEAP (Ham's Motto)
With this you would have a universal mount adjustable for sunlight, seating position etc.

A Hams mantra should be GROUND GROUND GROUND !!!

Ground the rig w\ back panel screw to known ground on body as close to
radio as possible. Same w\ ant. (any type of ant.)
Shield from RG-8 works well (flatten, solder ends & drill for screw) or solid
copper strap.
Are you a HAM or a car preservationist ? drill a hole and mount the antenna
properly. You can find a new wife. But missed DX is gone forever.

You have pointed out the one problem with the approach. The visor is not useable.

However, in most cases I found by moving my head a little I could use the 706 head as a mini-visor.

Subject: [FT100] Re: Anybody tried mounting the control head to an overhead console?

Here is an idea I have used with my 706. Fabricate a bracket from plastic material or metal. The bracket is "L" shaped with an extra "L" that forms a pocket with the foot of the first "L". This pocket slips over the sun visor and the other half of the "L" hangs down from the visor to mount the radio head. This give you a very neat heads-up display. Even when you are looking at the radio you are looking straight ahead.

The construction is rather difficult to envision without a picture, so I will attempt a basic drawing "in character mode" below. If that does not work and there is enough interest I will do a drawing an attach it to a message.

Amazingly, the text-drawing did make it through!

What happens whan the sun visor is deployed? Thanks

I was figuring on doing something like this anyway when I was originally considering using 7' Hamsticks. It makes no less sense with the ATAS-100, although I'm not too concerned with security in the building I work in.

>I do not recommend you mounting the antenna on an angle as this will cause

Looking strange, I can deal with. But the mechanical stress is definitely an issue. And after hearing about the possibility of problems with the Lakeview mag mount, I think I'll bite the bullet and pick up a trunk mount of some kind. (I wish there was info on the MFJ web site for the MFJ-345 mount that Tom K4IIJ mentioned on the MFJ web site. Tom, does it have an SO-239 fitting?)

Sorry Russ,

After I sent the post, thought about including http://mfjenterprises.com/new/mfj345.html . Yes, it does have an SO-239 and the requisite black plastic cap. If you are considering a separate 2M/440, look at the http://mfjenterprises.com/new/mfj1412.html or the http://mfjenterprises.com/new/mfj1432.html or the http://mfjenterprises.com/new/mfj1422.html

I got the "1412" which comes with an NMO adaptor so I can switch to the 300Z which has that lip mount. Downside - not in black.

Ok here is the deal. I've herd from a source (unofficially) that there is a much wider band mod for the ft-100. First the Ft-100 used the same PA for 2m and 440 that is centered near 220. This mod should give you full TX on 220. From what I've been told there is software somewhere on the net that will mod the radio using the virtual jumper setting similar to what it used in the vx5 and vx1r. If anyone runs across any info about this please pass this along to the rest of us. Please note I don't own a ft-100 as of yet, so I haven't had a chance to verify the info about the single pa for 2m and 440. If by chance the radio diagram proves other wise pleas let me know!

I can't say personally that there is only one PA for both 2m/70cm, but that
is what I was told directly by the tech at Yaesu when explaining why the
Ft-100 draws so much current on those bands. By my informal calculations,
the PA should be 80-100 watts capable in the 220 band. I have no idea how
well it receives there though.

285. Flaky unit?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-12 13:02:02 UTC
From: radio@xxxxxx.xxxxxxxxxx)
Topic: 285 Message: 285

I just purchased an FT100. I also bought the Yaesu "PowerGain" 100 auto-tune Antenna that supposedly matches the rig. I have had nothing but trouble from the two.

I'm using an Astron 25A Power Supply. The FT100 will shut down when trying to tx on 2m. If I back off the power to near 30%, it may or may not work. (Same power supply runs my 890 just fine).

The unit's logic to tune the antenna must be broke. If the tune fails, the unit will not transmit on any band for any reason.

With enough fooling around with it, I can get the xmitter back on.

Then the rig won't tune the ant without some really serious button pushing, time and patenience.

Put it on a fully tuned R7000 Cushcraft vertical.

Now the rig won't xmit at all, with the red light on, but no power output whatsoever.

Wait, now it's producing power again. Don't know why. SWR near flat.

Nope, it wont put out again. Transmit light stays on 1 sec after I release key.

Rcvr is horrible - even with filters cant understand nearby 20m qso.

I give up. Maybe I'll just try the 706G till Yaesu gets the bugs out of a potentially remarkable unit...

I received my FT-100 last week. So far, I have had no problems and it seems to work great. My only complaint so far is that you can't directly enter frequencies from the DTMF microphone pad (a minor irritation) and it doesn't seem very sensitive when scanning. I did a side-by-side scan on a bunch of AM aircraft frequencies with my ICOM receiver and the Yaesu failed to stop when the ICOM did on some weak signals.

I also got the FC-20 tuner, as I wanted to use a single whip antenna on my truck. It tunes very quickly, but I'm somewhat dissapointed as it won't tune my whip on 80m, 40m, or 17m (my Kenwood TS450-SAT would tune anything anywhere).

You missed the first two weeks about three to six FT100's blowing PA's and running HOT, birdies,spurs and complaints about the manual. Don't know if there is an archive of this reflector but several radio's did not make it past one day and some 3 or 4 days of operation before being sent back to Yaesu. There have been NO problems reported on the 706MKllG to my knowledge have the G Myself and it awesome.

Well...
Non scientific, partisan, but here goes... The local guy with the 706 tried to work another local
station on 6m USB. I followed them (from 2m) and could not hear the 706. The other station had
a fine signal. After listening for a bit, I jumped in and had a quick QSO with the station which could
be heard. Turned out to be an older Yaesu rig with 6m in it. I made the required jokes about brands.
We found, after moving back to 2m, that the 706 only had about 10 watts output, but it's not clear if
that was by design or whether there were antenna problems on the other end. The three stations
form the vertices of an equilateral triangle with about 40 miles on a side. I was working from the car,
in the driveway, with about 11.5VDC supply. Had no problems whatsoever.

294. Remote Kit

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-12 20:11:57 UTC
From: Thomas M. Schaefer
Topic: 294 Message: 294

I received my YSK-100 remote kit today and installed it in my F150 pickup. It took about 30 minutes; most of which was neatly running the wires. As I have not seen a list before, I thought I would send one of the parts.

The kit includes:

1 separation cable and screws
1 speaker extension (1/8 male to 1/8 female)
1 Mic extension (2 RJ-11s)
1 Mic coupler complete with holes and screws to mount the mic interface
1 bracket to which the face plate slides
Assorted screws

So, I have three cables running to the radio, Separation, speaker, and Mic. The radio base is mounted behind the seat and I am mounting the faceplate base on a cell pone pedestal mount that I will attach on the side of the instrument cowl. That is it! I'm done. What a radio!

BTW, I get the fan noise on startup as well.

Tom

Michael -

Were you referring to me? radio@... is indeed an active account. I own and run an ISP shop, and it's just as alive as the other 24,000 email accounts I host. In fact, it has a higher segmentation class on an Silicon Graphics server, with tremendous throughput.

But I'm sure you know what you're doing, and were not referring to radio@... so plz ignore this...

Greg

BTW - Yaesu confirmed all my problems, but really had no solution. I think all of this is caused by my environment, namely RF in the shack. I'm gonna stick it out with the FT100, it's just an impressive, innovative little rig. A bunch of initial bugs it appears, but having owned many Yaesu rigs before, I've known these guys to bend over backwards to keep the customer happy. They hand delivered a new FT1000-D one day when mine went out. Don't need to say more...

Plz do your own research on this rig (FT100), and make your own assumptions. I just wanted to let yall know the problems I'm having. I've spoken with one other person who was experiencing the same sort of thing, yet 5 others I know who are having no problems whatsoever. Go figure.

>the FT-100. After reading this list for a while now, I get the impression
>that many people here like having the latest in portability.

This month's QST has an ad in the back for a black nylon carry case
specifically mentioning the FT-100 as a suitable radio to take portable.

It would be nice if the receive drain were less. Perhaps a hack to
disconnect the dial-lights. I doubt that simply dimming them all the way
would do much, because they probably didn't put any effort into doing that
efficiently.

Bill,

What kind of whip are you using? I have a 9 foot CB whip on my car and the FC-20 will only tune down to 20m if it was already turned on. If you turn it off and then try to turn it back on, it will just shut off. Straingely enough it WILL tune that low, you just have to key the transmitter with the tuner already turned on to get it to do it. It is a bit disapointing. I had the same expierence with the tuner in my old Kenwood TS-440sat, it would tune my whip all the way down to 80m no problem! I am supprised that the FC-20 just doesn't seem to have the BEEF it should have.

This may have changed slightly over time. My unit required the
memory clear reset sequence (DSP + LOCK + PWR) to "sample" the
state of the configuration jumpers (replacing the sequence which
is described as resulting in "r on"). Remainder of information
is in accord with how my rig behaved. My rig also had jumper 1
not installed by the manufacturer. Note that the memory reset
init results in a cute display about "initializing" with a little
text bargraph. In any case, the reset left the menu settings
intact, which was nice (ARTS callsign programming, et. al.). Note
that this, unlike other Yaesu HW modifications, left "Automatic
Repeater offset Selection" intact for 2m/70cm. The need for a
reset is in accord with all other yaesu rigs I've owned, fyi.

When did ICOM start shipping the MKIIG ?? HRO still says its coming.
BTW, my FT-100 worked as spec'ed right out of the box and still works
just fine. I have been on this reflector since early on and I must question
those numbers ... ie ..."three to six"... and ..."several" ... .
Yaesu did it again, with gusto !!

I've had my FT100 for a couple of weeks. I love this radio.

Tried it first in the shack on HF into a G5RV through a tuner. Worked FB except didn't try it on 6M. Also worked the 2M/440 into a homebrew co-linear antenna and worked FB there, too.

Installed it in my Suburban over the weekend. Using a High Sierra HS-1500 "screwdriver" antenna for HF. Requires manually tuning the antenna to each band, but works very well. Worked a number of DX station with complementary reports on signal and nice, crisp audio. Using a magmount 2M/440, and that all appears to do a good job, too. Haven't had an opportunity to try 2M SSB yet, but will try as soon as conditions allow. Heard two stations (barely) this morning - very clear. Didn't move the "meter" at all. Had to go into work, so didn't have a chance to try to get back to them. No idea how far away they were.

I mounted the radio using the remote kit. The control head is on a swivel type cell phone holder I attached to the front of the console between the two front seats. Head is just at the right place to reach with my arm on the rest. Radio is mounted to the floor on the transmision hump. A note on the mounting bracket. It is painted black and does not make contact (ground) with the radio as it comes stock. I got out the dremel tool and ground the paint away from the inside around the screw locations. Same for where the screws go into the floorboards. Now the radio makes a good ground contact with the bracket and the bracket with the body.

Only bugs found so far:

Before I got the radio "grounded", found that something was squeeling a bit while tuning the antenna. The good grounding fixed that.

While "scanning", especially with Noise Blanker on, if a statio breaks squelch - manually tuning with the VFO knob makes sounds like a frequency "quantizer". Could be clipping, but doesn't necessarily happen with "strong" signals. Very briefly keying the mic clears up the situation. Not what I'd call a problem - just a minor annoyance.

The radio is temperature sensitive. Yaesu warns about that. Believe it. With the radio sitting on the dashboard (before final/permanent) installation in the direct sun, the audio would fade away. I hadn't touched the case up until that point, but burnt my fingers when I picked it up to set on the seat. With it mounted down out of the sun, it stays very stable.

No other problems detected.

Did I day I love this radio?

Regards,

Bill, KC5PJW

Ken:
While I haven't had my hands on a 706MKIIG yet to see if there have been
significant changes, there are some substantial problems with the 706MKII.
These range from a basically useless noise limiter to functional problems
that make it a hazzard to operate. I also had to send my 706 in for repair
after two weeks when it totally flaked out.
As far as the FT100 goes, so far I have no complaints. I'm holding out
on judgement of the receiver until I can get the unit back from my partner
and put it on my IFR. I also now have the AM filter, which it desparately
needs and I want to test the radio again with that in. Short of any
problems there, as far as I'm concerned, it's a GEM!

Could we visit this? I find the AM wierd. It seems broad as a barn door in the 6KHz position, not at all what I expect. A local AM station in the daytime occupies the channel above and below. Also, WWV on 10MHz has some other station just below it by some 15KHz dominating its audio. Yet, as wide asit is, it doesn't have broad high fidelity like some of the nicest AM stereo receivers of the '80's. And 2.4KHz is so narrow as to sound like crap, highly distorted and restricted.

SO is the optional AM filter wider still, narrower, more medium, what? Does it replace the 6 or 2.4KHz filter with something more appropriate?

Dang Yaesu for needing optional filters... it seems like they didn't leave "needed" options out years ago. It was one of the things I liked about the brand. Buy the radio, you're pretty much done. And what's up with requiring the purchase of a PL decoder? Oh well, waiting for your thoughts.

Pres:
While I still haven't been able to get my radio back from my partner yet (he must like it) I did do a trace of the AM filter on my IFR. It looks pretty good for what it is. My measurements make it a bit wider than spec, but only my 1 KHz. In any case, it will no doubt be better than the default AM reception of the FT100.
Your experience with the AM mode is pretty much expected for the radio without the 6KHz filter. You will pick up strong signals 10 or 15 KHz away or even more. Also the ultimate rejection is not all that good, so you may want to run with less antenna or less sensitivity (is it IPO or attenuator...he has the manual for the radio too...that's it, I'm taking him out to breakfast today and going to confiscate my radio back!). It will be interesting to see how good the ultimate rejection will be with the filter installed.
I can't address the audio quality till I get my radio back, but I don't remember it being a problem.

Paul,

I'm using a 102" stainless steel 11 meter whip, which is what I
used for years with my TS450SAT. The 450 would tune it on
any band, but the FC-20 only tunes it on 20/15/12/10/6 meters.
It may seem an odd antenna to use, but it has always worked
great for me and it's simple. I'm sure gonna miss 17m mobile.

It took me a while to figure out that you have to press and hold
the tune button to actually initiate tuning. On 17m, it doesn't
even seem to try, it just immediately gives you the "X swr"
icon and quits....

I also got the remote separation kit and mounted the xmitter
behind the seat in the truck and mounted the head on and
old celluar phone pedistal. Works pretty well.

Bill,

What kind of whip are you using? I have a 9 foot CB whip on my car and the
FC-20 will only tune down to 20m if it was already turned on. If you turn
it off and then try to turn it back on, it will just shut off. Straingely
enough it WILL tune that low, you just have to key the transmitter with the
tuner already turned on to get it to do it. It is a bit disapointing. I had
the same expierence with the tuner in my old Kenwood TS-440sat, it would
tune my whip all the way down to 80m no problem! I am supprised that the
FC-20 just doesn't seem to have the BEEF it should have.

Very interesting. I can't tell if my unit has NO filter, or a defective 6KHz filter.

But someone please tell me... what comes standard? 6KHz and 2.4? Or is it BLANK and 2.4? All I see in the manual is something about "optional" filter but I don't know what I HAVE and what the option is.

Wider?
Narower?
Medium?
Or something where I have nothing now?

My first impressions are limited but favorable. I put the rig on the air from my shack the day after I bought it. Running barefoot into a broadband dipole with tuner, I made a 60-mile QSO on 40m with good signal and audio reports, then worked Alaska on 20m. I have not had a chance since then to try it out much more than that; in particular, I have not put it on VHF/UHF yet, nor have I hooked it up to the ATAS-100. (I'm still waiting for my separation kit.) So far, I think it's great; admittedly I haven't done much, but on the other hand I haven't had any of the "out-of-the-box" problems reported here.

Of course, I'll keep the list updated with my experiences.

Charles,
Does your FT100 NB really work? be objective, its widely known about all Icom's NB lack of operation I just switched from a MK to a G and the G's NB seems better (still not great).You lost me with the "hazzard to operate" comment. It just seemed strange to me that most of the early FT100's were having so may problems. I know there a bound to be problems with any brand , this is my third 706 (1 of each version) never had a failure so far(knock on wood). Yaesu fixed the FT847's and I'm sure they will on the FT100 if there really is, It may be just some early quality control at the factory.

Pres,

With the radio stock out of the box there is no AM filter. The 6Khz position is used to assign the 6K filter just as the 500 & 300 Hz positions. There is a *BIG* difference in selectivity with the optional AM filter. I like to SWL during long drives and having the AM filter makes the difference on crowded bands of being fun to listen to or not worth trying. I really haven't tried it much on AM domestic MW broadcast because the AM/FM radio in the car has a much better sound/speaker system.

If you are into SWL I can for sure say the AM filter is worth the expense and hassle. If you don't feel comfortable soldering in tight places let the dealer do it and remember to use the placement diagram on the errata sheet and not the manual

While I haven't had my hands on a 706MKIIG yet to see if there have been significant changes, there are some substantial problems with the 706MKII. These range from a basically useless noise limiter to functional problems that make it a hazzard to operate. I also had to send my 706 in for repair after two weeks when it totally flaked out.
As far as the FT100 goes, so far I have no complaints. I'm holding out on judgement of the receiver until I can get the unit back from my partner and put it on my IFR. I also now have the AM filter, which it desparately needs and I want to test the radio again with that in. Short of any problems there, as far as I'm concerned, it's a GEM!

Hi, I talked to Yaesu Tech Support about grounding and the
ATAS-100, and he told me that they have had nothing but problems with
the K400 mount (in respect to proper grounding) and he hated the
mount. (I liked the looks of the mount myself) Anyway, I guess if
you run your own separate ground strap, then the K400 works just fine.

Ah! That make a world of difference explaining the effect. No filter at all.
You would think the position without a filter would be unavailable, like the
narrow CW positions are, but I suppose the 2.4KHz (SSB?) position is so
bad they gave you a listenable choice.

I wish that was clear in the manual. Thanks for finally "Clarifying" this!

Just an update -

I returned my FT100 :-(and purchased an MKIIG. I'm just so dissapointed that the FT100 wouldn't work in my environment, however it may be different I don't know. So I tried it one last time with Yaesu tech support on the phone, before I boxed it up:

1) Reset the CPU
2) Hooked up the -100 antenna
3) Went to 20 meters
4) Pressed "Tune" antenna
5) Antenna ran all the way down, paused, then moved 1" up
6) Waited 10 mins
7) Tried to xmit. Red xmit light came on, no power output at all.
8) xmit light stays on 2 secs after releasing mike key. ???

Another system reset got the xmitter working again, hooked to my R7000 (pre-tuned of course). Worked fine. Did the above procedure again, unit failed again. Put in box, purchased MKIIG.

The Icom is just a dandy little radio. Being picky (I know you guys find that hard to believe), I went over the MKIIG with a fine tooth. It works like a champ. Using a hardmounted Outbacker + a 2m/440 magmount. The digital filters work great. Audio is superb on *all* bands. Menu is logical. Only one problem I found with it: Icom ships it with a cheaper mike, without a DTMF keypad. If you want DTMF, you've got to shell out another $100 or so.

It's not my intention to blast the FT100, but felt compelled to let you know my experiences...

Ken:
Yes, the noise blanker on the FT100 works real well and isn't bothered too much by strong nearby signals. The noise blanker on the 706 I have is useless under most conditions and simply can't be used on the foreign broadcast bands. Even though my vehicle is a diesel, there's enough other noise sources on the highway that I need to have a good noise blanker. Also, even though the the DSP on the FT100 is an adaptive filtering version, it's much better than the DSP on the 706MKII.
The "hazzard to operate" reference is related to the stupid behaviour of the 706MKII for working repeaters on VHF. I'm regularly find myself transmitting on a repeater input when I intended to transmit on HF and It's such a pain to use for new repeaters that it's unsafe to use it while driving.
I think you're making a rash assumption when you say "most of the early FT-100's were having problems". Yes, there have been a few on here who have had problems with them, but there are also a good number of people who aren't. Mine is an early unit and so far it's working fine.

Chuck

Jory:
I don't have the specs in front of me, but I believe the default AM filter in the FT100 is about 15 KHz wide. That's wide enought that you don't have a chance separating all but the stronger stations on SW Broadcast. The 6 KHz filter will do a pretty good job of eliminating stations 10 KHz or more away from the frequency you're listening to. The filter will help for use on the ham bands because again it will significantly reduce interference from signals close to your operating frequency. Since the AM aircraft band isn't as crowded, you won't need it there as much as you would elsewhere.

>I'm sure they'll be an "FT100MKII" soon.

Maybe, but according to the new receiver restricting FCC rules not "AS WE KNOW IT." (rules adopted March 25, 1999 and released March 31, 1999, below are excerpts from an ARRL report).
If these FCC rules go into effect as planned, It looks like the FT-100 will be the last of it's breed approved for sale in the U.S. I would think that this will make the used price of the FT-100 stay high, similar to what happened to the RadioShack 2006 scanner.

Excerpts from the ARRL report:
FCC Issues Strengthened Scanner Receiver Rules
The FCC has amended its rules to strengthen existing prohibitions ... ***they will have important ramifications for the manufacture of new Amateur Radio equipment that scans frequencies outside the ham bands.***
The new rules broaden the definition of a scanning receiver to include receivers that
automatically switch among two or more frequencies between 30 and 960 MHz and are capable of stopping at and receiving a detected signal. .....
the FCC clarified that the rules do not apply to Amateur Service receivers ***UNLESS they cover frequencies outside the ham bands.***
...***The FCC adopted a more generalized requirement that receivers be designed so that tuning, control circuits, and filtering be inaccessible, and that the design be such that any attempted modification would render the receiver inoperative.***
The new FCC rules also prohibit modification of scanning receivers as a business or on an ongoing basis ''regardless of the date of manufacture or number of units modified.'' The Commission also said modification of any scanning receiver is prohibited and invalidates the equipment authorization. New, permanent labels on scanning receivers also will be required.
Kits for scanning receivers would be treated the same as assembled equipment.
...The FCC said it was modifying its rules ''to clarify that the prohibition on modifying scanning receivers to receive Cellular Service transmissions contained in Section 15.121 overrides the home built device provisions of Section 15.23.''
The proposed new rules become effective due 30 days after their publication in the Federal Register. But the FCC said it will include ''transitional provisions in our rules to allow the acceptance of equipment certification applications for scanning receivers under the current rules for up to 90 days after the publication of the R&O.

A copy of the Report and Order is available at
http://www2.arrl.org/announce/et98-Rand0.html.

I've had one of these for a couple of years and no problem so far with its electrical performance. It will take a CR627 at 100mph and tunes up well on the three bands I have. The mount is infinitely variable in its adjustment of aerial angle and I haven't noticed problems arising from poor grounding. The only downer is the black paint has all peeled off, this is probably due to living on the Channel coast and the salty air.

Well, I finally found my favorite feature. The SQL menu lets you set the squelch control to be squelch in FM mode, but RF gain in other modes. This means that when I change from 20 meters USB to 2m FM, I do not need to adjust the control. The only adjustment is that our local repeater cannot open my squelch if it is set all the way up, so I back off a bit. This does not seem to effect the RF gain at all.

Tom

Topic: 324 Message: 326

There are three modes. Stop scanning, Pause, and Hold. Stop, ceases scanning when something breaks the squelch. Pause, temporarily stops scanning for N number of seconds (menu configured.) Hold, stops scanning until the frequency is clear, then waits N seconds to resume.

73,
Mike

Topic: 327 Message: 327

I just put the final piece of my installation in today. I got a 6 inch cell phone mount that swivels all around (technical terms, I know!).

In my F150 with the Ford noise generating option, I mounted it just to the right of the instrument cluster over the sloped vent. The radio face is now out of the way so it does not interfere with the road. I can tune the radio easily without shifting around. It is one cool thing.

The mount is a Panavise mount. Nice stuff.

328. Separation cable pb

I put on the separation cable tonight and had an odd thing happen. The vfo button only beeped and would not change to memory. When I tried to tune the ATAS100, it showed "antenna error" in the window. I tried several things, even reset the cpu, but no good. Finally, I took off the separation cable and re-attached the face to the main body. It works fine. What gives?....Dale KC2PZ

Possibly connected upside down? I did notice that the picture in the separation kit show the connector facing the wrong way on the cable to rig mount. But, the cable does seem keyed, so that might not even be possible.

What would be great is if those mounting the remote could post a
picture to your web page or perhaps have a .jpg which you could attach
for those of us interested in seeing your efforts - you know, that
"picture is worth" thing. Forgot to ask the Suburban owner for one but
will when I dig back through the messages.

Hello all,

from France. I'm new on this list!
I'm not a FT-100 user but a FT-1000mp...
and i will like to know more about the FT-100 it's why i wanted to join this list.
I like to know your thinks about the FT-100!
And to know how the dsp to the FT-100 is used on it is it a same dsp like the FT-1000mp???

73's de Thierry, proud to use Yaesu.

332. Effective filters and DSP ?

Hi!

I still haven't received my FT100 but since I'm going to use it mainly on CW I was wondering if anybody has tried the 500 HZ or 300 HZ optional CW filter. How good are they and wich one would be the preferred filter as an addition to the DSP filtering? I bought the 250HZ for my FT1000MP but I think I could have saved the mony experiencing how well the DSP works with only the 500HZ.

How many FT100's are on the market now and are the problems described in this list from *the* first-first delivery in the US or do they keep coming along with the deliveries - any ideas about that ?

Last - any reviews popped up here on the internet ??

Bill,

Can you get the FC-20 to tune down to 20m by just turning it on? I am beginning to wonder if my FC-20 has a problem! Like I said if I have the tuner turned off and attempt to tune my whip it will only work on 10m!! It seems to give up on an swr above 2/1. I know the manual says 3/1. The only way I can get my tuner to work below 10m is to turn it on on 10m and then change bands. When I key the xmitr via PTT on the new band it will tune the antenna flat. BUT if I try to get it to tune once it has been turned off it fails! I don't like having to "fool" the tuner into working. Does this sound like your tuner or should mine work better then it does? I am not using an FT-100, I have an FT-847 but I can't see how that could make any difference. I am going to drop Yazzoo a note about this and I'll foward the info to the list.

Hi Per,

I used the FT-100 in the shack for a few weeks before I put it in the car. I worked a bit of CW with it connected to a 10 element Log Periodic and here on the East Coast you can get quite a bit of crowding from Europe on 20 meters when the band is open. The DSP is good and similar in CW to the MP (I own a 1000mp too) but in the audio chain after the AGC. This means without a narrow DSP setting you may be able to clean up the sound of adjacent signals but not the AGC pumping. I use a 500Hz Yaesu filter and a 400HZ INRAD with sharp skirts in the MP and I'm sure the Yaesu 500Hz filter for the FT-100 isn't that sharp. Since the FT-100 isn't a contest rig my guess is that you would be able to get away with the 500Hz filter and the DSP unless you were trying to do weak signal work on crowded bands.

Anybody else on the list using the CW filters? how about opinions.

Paul,

There is a "Tune" key on the FT-100, and the only way I have found
to truly make the tuner tune is to press and hold that button down. The
manual says you should only have to do that to store it in the FC-20's
memory (it supposedly has 100 memories). I was led to believe by
the manual that you could just tap the button to initiate tuning but not
store the frequency in memory, but I don't have a good feeling that
it really tunes because it's too quick (split second, and the fan in the
tuner doesn't come on like it does when you hold the button down).

I have tried switching to a new band and pressing the PTT to see
if that would initiate tuning but it doesn't seem to, unless I'm doing
something wrong.

If anyone else got an FC-20 with their FT-100 it would be nice to
know how it's working for them....

Bill,

I dosen't seem to make any difference how long I hold the TUNE button down. The tuner will not tune below 10m (on my whip) without first tuning on 10m and then swithcing bands and using PTT. My tuner is like yours in one respect; if I just tap the button it just turns on but dosent do any tuning. If I hold the TUNE button down then the tuner will attempt to tune the antenna. The problem is that either way it won't work below 10m. If it is already on, and I key the transmitter THEN the tuner will tune down to 20m! If I push and hold the TUNE button with an SWR above 2/1 then the tuner just shuts itself off. Very strainge. I sent an email to Yaesu tech support, we will see what they say.

I plan on taking some pictures this weekend. I'll put them up on my webspace and send the links to the list. That way those that don't want to see them don't have to spend the time to download them. Also, the digest version of the list might not receive attachments properly.

Subject: [FT100] Effective filters and DSP ?

Hi!

I still haven't received my FT100 but since I'm going to use it mainly on CW I was wondering if anybody has tried the 500 HZ or 300 HZ optional CW filter. How good are they and wich one would be the preferred filter as an addition to the DSP filtering? I bought the 250HZ for my FT1000MP but I think I could have saved the mony experiencing how well the DSP works with only the 500HZ.

How many FT100's are on the market now and are the problems described in this list from *the* first-first delivery in the US or do they keep coming along with the deliveries - any ideas about that ?

Last - any reviews popped up here on the internet ??

International Radio is located in Umpqua, Oregon.

See http://www.qth.com/INRAD/

Or call them at 541-459-5623.

346. Still deciding between FT100 and 706MK2G

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-15 15:05:23 UTC
From: The Huie Foundation
Topic: 346 Message: 346

Greetings,

I've been debating which unit to get for about two weeks. I've valued the information that I've gotten about the Ft100 on this list. Keep up the great work!

After spending over 5 hours reading both manuals and playing with each rig, I can say that I think I like the FT100 better in terms of features and ergonomics. I'll list some of the advantages of each radio and if anyone has comments regarding my comments then please send them along. As far as I can tell, the ICOM will cost about $200 more by the time I add some accessories (ICOM accessories are either more expensive than Yaesu's, or not supplied as standard equipment).

Part of my BIG fear of Yaesu stems from a bad experience that I had in 1985. While I was in college I saved my pennies and bought my first mobile rig, Yaesu FT-2700RH dual-bander. I chose it over the Icom 3200 because of the price and features. It spent 8 months out of 10 in the shop, first failure occuring within 30 days of purchase. HRO (where I purchased it) was no help whatsoever. The radio never quite worked as well as I had expected (in comparison with the display model) and I rather regretted the purchase.

So, in 1999 I'm making the same comparisons. Ideally, I'd like a mobile antenna tuner that can is weather proof and mounted outside the vehicle, such as an ICOM AH-4. Can this auto antenna tuner be controlled by the FT100? Is there an equivalent Yaesu? What are my options for mobile antenna tuners? How about an SGC model, like the 237 (http://www.sgcworld.com/sg237/index.htm)?

Here are intiail thoughts on "advantages":

YAESU:
1. Many more memories.
2. Several cool features, such as scanning and auto programming memories.
3. DTMF mike included.
4. Menus/controls are friendly (ICOM setup requires power off/on multiple times).
5. $50 less than ICOM (retail prices).
6. Takes serial data from computer (inexpensive cable or homebrew). ICOM requires $80 cable.
7. User groups on the web such as this one! ICOM users do not seem to be posting any info
AT ALL on the web. None of the search engines have come back with very useful

info from users when using keyword(s) "706MK2G", "706MK2", "706MK2
G" or "706MKIIG".
I even searched www.dejanews.com and only found one thread. Has
anyone bought these? ;-)

ICOM:
1. 3rd generation (higher reliability?)
2. Backlit keys (and independently adjustable)
3. Higher contrast screen (apparent when backlight is turned off)

I couldn't tell which receiver was hotter. I tuned both rigs (switching
to the same antenna) and the audio
and selectivity was nearly identical on all bands. Scope functions
worked similarly. Also, the stated
current draw on the ICOM is similar to the Yaesu, but I'm not sure if it
has one broadband P.A. or two.

Can someone check their Yaesu to see if you can change the transmit
frequency while the PTT is
held? Also would like to know if you can change the CTCSS while the
PTT is down.
I checked the ICOM and it allows for this, but didn't have time to check
the FT100.

Right now, I'm 75% sure I'm going to purchase Yaesu, and 30% sure I'll
purchase the 706MK2g.

I'm still concerned that Murphy's law will strike me again and I will
end up with a dead radio out of the box
followed by a history of problems. I don't make these purchases very
often and not real pleased with Yaesu's
quality control (once it took them 2.5 months to repair / return my
dual-bander!).

Comments appreciated!

~Keith (KA6NBK)

Topic: 347 Message: 347

I was wondering if anyone has found a source for the power cord? I called Yaesu yesterday and the haven't any info for a replacement(so you can move the rig from the vehicle to the house). If anyone out there knows of a source please post.
I really enjoy the rig I also have the tuner and noticed that once you let the rig know that the tuner is installed that I had to turn off the rig and turn it back on to get the tuner to work. I have not had the 10m problems described in prior messages.

From: K9ZZE@xxx.xxx
Topic: 348 Message: 348

Have owned my FT-100 for about two weeks now and have been reading postings on Onelist for about the same length of time. Thought it was about time I at least made a couple of comments.

I've wanted to go "Hf Mobile" since about age 15 when I watched my Elmer and helped build (my indoctrination to soldering) a Heathkit HR-20 receiver and matching mobile transmitter (don't remember the model #). They were Huge ! - but then, there was a lot of room on the floor in front of that bench seat.

Actually put a deposit on and placed my order last August and then put up with hearing so many times that it would be out "Next Month." Well, it was certainly worth the wait. Even for a klutz like me, the radio was very easy to learn - very intuitive. Spent about two hours with it on the desk - setting it up, learning the basics, and programming a few memories. Once installed in the car, I was on-the-air and making contacts within minutes. Worked Netherlands, Germany, the UK, and numerous stateside contacts including a Special Event station in Florida on 15, 20, and 40 in the first few hours with excellent reports on the audio.

My mobile installation is in a '99 Mazda Miata. The battery is located under the floor in the right-rear fender well and this helped a lot - believe it helped a lot with noise immunity as the power leads are only about 12" long and the coax (LMR-400) run to the base of the antenna (ATAS-100) is less than four feet long. Being able to remote the control head really made it all possible as there's precious little spare room in the car.

My Brother welded a receiver type hitch to the frame and custom made a removable (although it is bolted and set-screwed in the receiver) riser arm which allows the base of the ATAS-100 to mount on a plate about level with the top to the trunk lid.

The body of the radio is mounted on the far right-hand side of the trunk floor. The standard cradle which came with the radio is mounted with six metal screws which go down into the frame rail and an additional 1-1/2" wide copper strap about 10" long is screwed down over top the the cradle and attached also to the frame rail a couple of inches to either side of the cradle. The ears of the cradle then go through the carpet. A second ground strap circles the body of the radio, placed under the ears of the cradle and is screwed to the frame rail.

Have had no complaints, no "glitches" or problems with the radio and in two short weeks, already many enjoyable hours of operating. Purchased the optional ATBK-100 base kit (a collar with four radials - two of them coil loaded) and plan to use this package as a suitcase portable station a lot over the coming months.

Will purchase a tuner in the next couple of weeks but believe it is not going to be the FC-20. Seems to be very limited with the load it will work into and from what I've seen so far, my purchase will more than likely be the LDG unit (AT-11 automatic antenna tuner) as one of the specs for this unit is that it tunes 5 to 850 ohms. They also offer an optional balun kit for this tuner that allows it to work with a long wire antenna. More on this later after I'm able to spend a few hours with it.

The ATAS-100 automatic screwdriver antenna is another story. Very satisfied with the way it works on the Hf bands and very disappointed with the way it works on 2 and 440. I've been using a Comet SBB-7 dual band antenna (1/2 over 1/4 wave on 2) on the front edge of the trunk lid for the past few months and wanted to be able to remove this antenna after installing the ATAS-100. Well, looks as though I'm not going to be doing that - not if I want to continue working through the repeaters which I do. The ATAS-100's performance on 2 is just despicable and almost as bad on 440. I've not as yet been able to try it on 6m, but I really wish Yeasu had simply called it an anteena for 6 through 40m. Did a very simple simplex comparison between the Comet, a 1/4 wave magmount (in the middle of the trunk lid), and the ATAS-100 on 2m and 440. The 100 was a full 'S' unit down from the quarter wave.

Only question I'd like to ask is if anyone has as yet tried putting something together in the form of a single-ear headphone/boom mic setup. I spend a lot of time with the top down and this is almost a necessity for me. Thought I would contact Heil and see if they might have looked at the 100 as yet. Any other thoughts ??

Off to do some Hf mobiling - Have enjoyed the Onelist posting a lot.

The better deal will be the FT-100. Any rig can have its bugs!
Being a former owner of the IC-706 (rev-1), and now owning the FT-100, I would't go back to Icom.
Unless Icom did some DRASTIC changes to the IC-706MKIIG, the FT-100 will out do it????
And from the Icom specifications sheet they sent me, they have not changed much from the orginal 706!
The only bug I have found (if you call it one) is the fan makes noise for the first couple key ups, then goes away! This is after being off all night or for several hours!

I run the FT-100 with the screw driver antenna, 80-10 mtrs, use the Ham stick on 6 mtr, and run the M2, 2m and 70 cm HO loops for side band while mobile! Works well.

I also have the FT-847 for the base, and after having this for a year, its nice to have a mobile version of it to use.

Wish you well.

I have just heard that it is not possible to connect headphones to the
FT100! Can that really bee true ? a rig without connection for
headphones... :-(

True, but the manual recommends building a simple attenuator
to attach between the spkr jack, and your headphones.

Wow. I heard that there is no tuning knob either!!! Only an optical
encoding frequency control wheel.

Have we really reached the dumbing down point where it's beyond the skill
set of most hams (not those smart enough to read this list) to build an
attentuator (if even required!) for the external speaker jack?

Just biding time waiting for mine to show up.

If you have to use the external speaker jack for a speaker (due
to remote mounting), it sure would have been nice, though, to have
a true phone jack on the head like the Icom....

From: radio@xxxxxx.xxxxxxxxxx)
Topic: 357 Message: 357

I just spoke with HRO, who took my FT100 back last week after significant power output problems (I exchanged it for an ICOM MkIIG). According to HRO, they had one returned for the same reason prior to mine. And since my return they've had three (3) more units returned for refunds, all power output problems of one sort or another! Yaesu wants them back @ the factory ASAP to figure out what's going on. Believe me, they'll fix it - that's sort of Yaesu's MO.

But this really peaves me. Yaesu has been advertising this unit since last October, with a "Call your dealer for price". I'm told the dealers had no idea what was going on. Now that it's here, it's got problems. Is this normal? I remember my first FT1000 was full of bugs, but again Yaesu jumped all over it and had it (and most other units) fixed pretty quick.

I still plan on purchasing an FT100, but I'm gonna give it a few more months. Maybe at Dayton. The whole idea of this rig is superior and modern.

Is there anyone out there using the A-100 auto antenna with the FT100 with any success?

Greg

I've been using an ATAS-100 since January on top of my Blazer. First I used it with my FT847 and now the FT100. Works beautifully on 30-6 meters. For 2m/70cm it works about as well as a 'cellular look-alike' type dualband antenna (i.e. it works ok, but could be MUCH better) It occasionally gives me fits on 40m with the FT-100 (never a problem with the FT847) I'm fairly certain it is ground related and will investigate that this weekend.

Well, without getting too personal (wich I'm sure is not the purpose of this list) some people just might bee able (skilled enough?) to see the need for BOTH a ext speaker jack AND a headphone jack. I'm one of those so I asked...

I think that it's pretty easy to see that there is simply not enough space for everything. Look at it this way, Yaesu as at least provided a way to get audio OUT of the rig while disabling the internal speaker. Now... you may be surprized at what one can do with a soldering iron and a couple headphone jacks and an inch or two of wire.

I think we all agree that there are a couple more nagging problems, like direct entry of frequencies from the microphone, which would be nice.

There is no separate headphone jack....However, the instructions show how to put a resistor in the speaker jack to cut back on the power and audio....I have not tried this but it looks like it will work. Dale KC2PZ

My FT100 plays great audion on 95.7 here in Houston, but the signal
strengh with the ATAS100 for some of the other stations is way down.

Subject: [FT100] Still deciding between FT100 and 706MK2G

From: The Huie Foundation <bond007x@...>

Greetings,

I've been debating which unit to get for about two weeks. I've valued the information that I've gotten about the Ft100 on this list. Keep up the great work!

After spending over 5 hours reading both manuals and playing with each rig, I can say that I think I like the FT100 better in terms of features and ergonomics. I'll list some of the advantages of each radio and if anyone has comments regarding my comments then please send them along. As far as I can tell, the ICOM will cost about $200 more by the time I add some accessories (ICOM accessories are either more expensive than Yaesu's, or not supplied as standard equipment).

Part of my BIG fear of Yaesu stems from a bad experience that I had in 1985. While I was in college I saved my pennies and bought my first mobile rig, Yaesu FT-2700RH dual-bander. I chose it over the Icom 3200 because of the price and features. It spent 8 months out of 10 in the shop, first failure occuring within 30 days of purchase. HRO (where I purchased it) was no help whatsoever. The radio never quite worked as well as I had expected (in comparison with the display model) and I rather regretted the purchase.

So, in 1999 I'm making the same comparisons. Ideally, I'd like a mobile antenna tuner that can is weather proof and mounted outside the vehicle, such as an ICOM AH-4. Can this auto antenna tuner be controlled by the FT100? Is there an equivalent Yaesu? What are my options for mobile antenna tuners? How about an SGC model, like the 237 (http://www.sgcworld.com/sg237/index.htm)?

Here are intiail thoughts on "advantages":

YAESU:
1. Many more memories.
2. Several cool features, such as scanning and auto programming

memories.
3. DTMF mike included.
4. Menus/controls are friendly (ICOM setup requires power off/on
multiple times).
5. $50 less than ICOM (retail prices).
6. Takes serial data from computer (inexpensive cable or homebrew).
ICOM requires $80 cable.
7. User groups on the web such as this one! ICOM users do not seem
to be posting any info
AT ALL on the web. None of the search engines have come back with
very useful
info from users when using keyword(s) "706MK2G", "706MK2", "706MK2
G" or "706MKIIG".
I even searched www.dejanews.com and only found one thread. Has
anyone bought these? ;-)

ICOM:
1. 3rd generation (higher reliability?)
2. Backlit keys (and independently adjustable)
3. Higher contrast screen (apparent when backlight is turned off)

I couldn't tell which receiver was hotter. I tuned both rigs (switching
to the same antenna) and the audio
and selectivity was nearly identical on all bands. Scope functions
worked similarly. Also, the stated
current draw on the ICOM is similar to the Yaesu, but I'm not sure if it
has one broadband P.A. or two.

Can someone check their Yaesu to see if you can change the transmit
frequency while the PTT is
held? Also would like to know if you can change the CTCSS while the
PTT is down.
I checked the ICOM and it allows for this, but didn't have time to check
the FT100.

Right now, I'm 75% sure I'm going to purchase Yaesu, and 30% sure I'll
purchase the 706MK2g.

I'm still concerned that Murphy's law will strike me again and I will
end up with a dead radio out of the box
followed by a history of problems. I don't make these purchases very
often and not real pleased with Yaesu's
quality control (once it took them 2.5 months to repair / return my
dual-bander!).

Comments appreciated!

~Keith (KA6NBK)

From: kd4fpt@...

I was wondering if anyone has found a source for the power cord? I called
Yaesu yesterday and the haven't any info for a replacement(so you can move
the rig from the vehicle to the house). If anyone out there knows of a
source please post.
I really enjoy the rig I also have the tuner and noticed that once you let
the rig know that the tuner is installed that I had to turn off the rig and
turn it back on to get the tuner to work. I have not had the 10m problems
described in prior messages.

Ever buy Microsoft products? Same deal --the first
few revs always are problem prone. No different that
Icom (uh...didn't they release an Icom 740, then the
745? or the IC751 and the 751A...or the 737...then
the 737A...and then there's the 706 and the
706MK2...etc).
Hey...even Collins did this (KMW2, KWM2A, 75S1...75S3
and the list goes on and on.

I had a 706 -- it was a lousy radio, period. No good
for CW at all. Filter blow by, noisy fan, etc.
Sounds like they fixed it in the 706MK2. Same will
problaby occur for the Yaesu 100.

As complex as these things are, it surprises me it
takes so little time to develop and release the
product.

Keep it in perspective. These things would have cost
ten kilo-bucks in the late 1980's...and at least 4x
the size.

From: Kent
Topic: 371 Message: 371

Hi all:....I just subscribed to this list today and surprised at the activity. It's great!...I have a couple of questions. What is a good price for this radio?...and from what I'm reading it sounds like it has a huge waiting list. Are there any radios to be had? How long has the radio been out?....I currently own 4 Yaesu radios. FT-101E, FT101ZD, FT-2400 and a FT-890. I've always been very happy with Yaesu and have never had a single problem...knock on wood...I also have a Icom 706 mk2 and this radio has been excellent also. I'm thinking of selling the 706 and getting the FT-100. I've used a CAT interface on my FT-890 and haven't been real happy with that. I'm getting polling lag. Has anyone tried running the FT-100 off their computer and run into any problems? I look forward to Field Day every year and play around on some of the VHF contests, so the addition of the 440 band looks attractive. Hope this isn't too much for one post. Thanks for the time. Kent K7CAR

>ten kilo-bucks in the late 1980's...and at least 4x
>the size.

Well, regardless of relative value, accepting poor quality seems a bad idea after shelling out lotsa bucks for it. Although I have only experienced a tiny problem that went away, I have yet to transmit, and I will have 1350 reasons to be pissed if there are problems.

Short time to come out with them? I saw one in Dayton last year! Criminy. They're not making solid rocket boosters here. Almost a year of prototyping is a lot of time to work out problems.

I'm disappointed in Yaesu, my favorite Japanese manufacturer, for the problems others have had, and I'm hoping all will be fine. I'm wondering if the Alinco DX-70, a radio known to have problems, isn't a better value at half the price...

Has anyone out there figured out how to get just one of each message instead of 4 or 5 duplicates of exactly the same message and answer? The reason I subscribed to this list was to get valuable information about the F-100(by the way I have 54 pickup with that same designator)in the
least amount of space and time.Getting a digest every day and with 3/4 of repititious and advertisements along with it is not getting it.
Any suggestions to getting the list less frequently and not repetitiously as I subscribe to 3 lists and simply dont have time to scan for new items everyday.Thanks for input 73 Chuck KD6ORL

Pres:
You seem to be jumping to conclusions that may not be correct. Yes, there have been a few that have had transmit problems and a few other oddities. What you don't have however is the number of units already out there operating just fine. That may be a symptom of this media more than the quality of the FT100's. Mine, for one, works just fine.
In defense of Yaesu, I'm glad they took the extra time before releasing the radio. I think it's clear from it's ease of use and performance that they put a lot of thought and hard work into that radio. There are however things that can happen when you put a radio into production. These range from errors in assembly to substituting parts with ones that are more available with unexpected results. Even the best pre-production quality control won't fully protect you from unexpected early production problems. I really doesn't pay to pannic when early production problems come up. If that bothers you, then you should wait a while before buying anything. Otherwise, you'll be jumping from radio to radio and manufacturer to manufacturer. One thing that should certainly be obvious is that Yaesu has about the best reputation in the industry for making things right with their customers. If you want some glaring examples of why this is so, I can provide them.

Chuck

Alright, Chuck, thanks for "reeling me in". I guess my panic was that I have
already bought the radio, haven't installed it mobile or taken an
opportunity to try and transmit, and I'm waiting for the other shoe to drop.
It did tap the floor the other day with the radio producing a constant
internally generated tone when in CW mode in receive. That effect went away
the next day.

Still, there is a clear pattern on the list of transmit related problems
locking on the air, poor output, ATAS not acting right, blah blah blah).
And as I said, we did wait almost a year for it to come out.

And yes, I am unfairly grouping the problems reported in this radio with
others facing problems on the VX-5R list. It's just that I have been using
commercial gear quite a while and I'm just getting back into Yaesu, which
used to be the "one and only" brand for me. I was concerned that quality has
slipped but more concerned that since the evil computers have been foisted
on us, we, as consumers have become more complacent. I tell ya, if the
products I sell were as crappy as PC's (which OS is IRRelevant) I would be

out of work, and maybe in jail.

I'm really glad to hear that yours is fine. And BTW, my Alinco went back for a warranty repair before I sold it to get the 100 as well! I'm also glad to be part of this community, and hope to contribute more than I learn as I get to know the radio in the next couple of months.

BTW, there is a "Yaesu Exit" from the JR Train station in Tokyo. Cool?

Is "tap the floor" equivilent to "drop"?

> Still, there is a clear pattern on the list of transmit related problems

> And as I said, we did wait almost a year for it to come out.

I've been thinking about the output problems. Once person who had to
send their radio back was pretty sure that the two fans on the back were
blowing in opposite directions. That clearly would cause cooling
problems and could be a result of an occasional production glitch. I've
verified that mine do both blow the same way, and my radio really never
gets hot even on long key-downs. As for the ATAS, I don't have a clue on
that. I've run the radio on my beam as well as running short tests with
the SGC tuner it's going to be connected to in the truck. No problems
there at all.

> And yes, I am unfairly grouping the problems reported in this radio with
> others facing problems on the VX-5R list.

I'm also a VX-5R owner and yes, there were some early problems with that
radio and one still lingering. Mine only has the slow PL decode issue
which I understand they may have a fix for now. However, it as well is a
real good radio overall and I do recognize that I got an early unit.
In contrast to some of the Yaesu issues, I could tell you real horror
stories about Kenwood and about their attitude toward their Ham Radio
customers. I think with any big company that has litterally hundreds of
products, you can't expect things to be perfect all the time. What makes
the difference is when they make things right!

A slightly higher current capable solution with the ability to be made 1) ganged and 2) prettier than 4pin cinch ... The Wes Allen plugs. I use 4 10ga wires, two each 12VDC and Ground, terminated in these plugs. Same idea, each vehicle and shack power supply provides hookups.

The 4 pin cinch was used on the FT747 HF rig, and they work well enough but are hard to solder with large wires.

I use 4 pin Cinch-Jones plugs in the car and in the shack. All are wired alike so I can swap rigs easily. They cost less than $2 each.

From: kd4fpt@...

I was wondering if anyone has found a source for the power cord? I called Yaesu yesterday and the haven't any info for a replacement(so you can move the rig from the vehicle to the house). If anyone out there knows of a source please post.
I really enjoy the rig I also have the tuner and noticed that once you let the rig know that the tuner is installed that I had to turn off the rig and turn it back on to get the tuner to work. I have not had the 10m problems described in prior messages.

From: Walsh, Tom
Topic: 357 Message: 378

In the discussions of each problem (excepting the blown transmit rf amp),
I think that each of the "it don't work" descriptions I've seen falls into
either

a) RF in the shack / poor ground
I've seen my FT747 rig lock up (tx) when I had
a terrible mismatch with a tuner (causing the
feedline to radiate into the shack). The issue
is simply that at some level of RF, the energy
is going to get back into the control circuitry
and cause odd / undesirable behavior.
I've seen my FT-100 rig with ATAS-100 be unable
to correctly read the VSWR and thus be unable to
correctly tune the antenna from a lack of good
RF (not DC) grounding of the radio. Use of a very
rudimentary (not very good) ground fixed that right
up. I'm actually surprised how well it works with
a really rotten ground. Some of the folks on this
mailing list have described the usual methods for
obtaining adequate grounding for HF mobile work.
They're pretty hard core... They didn't even say
nice things when I dedicated one small length of
ground braid to the problem...

b) other source of RF getting into the rig
The RX problem of tones in CW mode is consistent
with some other source of RF. Perhaps a neighbor
with a CB and a grudge against the world who left
a rig with a brick on the mic?

Not sure about the blown amp, but if memory serves, this amp was blown
during a "brick on the key" test, right?

There are some S/W bugs. If I'm not mistaken, prior to modifying
the radio to be capable of wide TX, the "select" knob could be placed
in 1KHz step rate for SSB. After the mod, the main tuning dial is in
that mode when it's selected, leaving the select knob in 10KHz, which
is very much too much for SSB, and sounds alot like 11m spacing...

The "fast" memory recall mode seems to be confused as well. Not sure
if perhaps I'm doing something wrong, will have to review the manual.

The CW peaking (audio dsp based) filter appears to not work correctly
for CW-R mode, although it could be (me) operator error. The 500Hz CW
filter works fine for this mode (opposite side BFO injection).

It is not possible, as is the case with each Yaesu radio I've owned, to program different CTCSS encode and decode frequencies. Both TX and RX have to use the same CTCSS code when using tone squelch. This is in practice not a big issue, although an occasional repeater control op will program the repeater that way due to ownership of gear which can do this relatively unimportant thing.

The "memory clear" reset clears the memory keyer's memory. Not a big deal, but unexpected by me.

The lack of automatic backlight dimming is a pain. The FT-5200 got this right - automatic with manual override.

The radio is a really tightly packed device. It will not live long if installed without adequate airflow. I tried the glove box. Not pretty. Don't even think about it. If installing under the seat, be certain to vacuum the area periodically and clean all vents on the radio. I'd sure check the fan directions as well, since someone noted that their fans got hooked up wrong (sounds like someone put the wires in the connector wrong?

Beyond this, most of the "complaints" I've seen are really nits. Lack of panel space dictates small jack for external audio. Need to drive speaker guarantees it's not at headphone level. The rig provides separate 9600 and 1200 baud digital mode hookups, CAT control, FC-20 and ATAS control, dual antenna jacks... Let's be reasonable. It's a fantastic radio with a few very minor bugs as mentioned.

Subject: [FT100] Thinking of selling my 706!

From: Kent <kent@...>

Hi all:....I just subscribed to this list today and surprised at the activity. It's great!...I have a couple of questions. What is a good price for this radio?...and from what I'm reading it sounds like it has a huge waiting list. Are there any radios to be had? How long has the radio been out?....I currently own 4 Yaesu radios. FT-101E, FT101ZD, FT-2400 and a FT-890. I've always been very happy with Yaesu and have never had a single problem...knock on wood...I also have a Icom 706 mk2 and this radio has been excellent also. I'm thinking of selling the 706 and getting the FT-100. I've used a CAT interface on my FT-890 and haven't been real happy with that. I'm getting polling lag. Has anyone tried running the FT-100 off their computer and run into any problems? I look forward to Field Day every year and play around on some of the VHF contests, so the addition of the 440 band looks attractive. Hope this isn't too much for one post. Thanks for the time. Kent K7CAR

Interesting -- I've had 2 Alinco DX70's since they
were released in Japan back in 1995 -- serial number
108 and 240. Neither have given a lick of problems!
Maybe I'm lucky -- but I've also managed to put at
least 50K QSO's on it from living/traveling around
Asia, mostly on CW.....

If you're not really into the 2M or 430 SSB, then the
DX70 is unquestionably a good value. On the used
markets, I've seen these go for as little as $550
(maybe less, now that Icom and Yaesu have released
their latest boxes).

Hello Thierry,

I also own a FT-1000mp and a FT-100. The main difference is that on the FT-1000mp you have preset choices for shaping what you hear ie.. choice A,B,C,D. On the FT-100 on the other hand you can dial in Highpass or Lowpass. I actually like the way they did this better than I did on the FT-1000mp. The digital bandpass on CW is really good although I do prefer mechanical filters and have a 500 installed for CW. All in all, I really can't find anything that I don't like with this little rig. The digital noise blanker is VERY impressive. I have it installed in a Ford Automobile which is known for their noisy fuel pumps and this actually makes it possible for me to operate in my car. If you have anymore questions just send them to me. clairopt@...

Any one had any problems with there FT-100 getting VERY HOT during a qso?

On a 25 min. qso on 6 mtr @ 50 watts, it got so hot,you couuldn't even touch the mobile mount!
This doesn't seem right?

Any ideas?
Wayne-N0ISV

Wayne:
I assume that wasn't key down for 25 Min! From my experience, the radio
should not get that hot. Check the operation of the fans in the back.
There's been some indication that they may not be functioning correctly in
some radios. They should both blow the same way.

Chuck

Hi all,

Been reading all your interesting postings about the FT-100,
Because I'd been saving and now is my turn to make up my mind
on wether to buy the FT-100 or the IC-706MKIIG.

I'll like to know If there Is any software out yet to computer
control the FT-100, like ICOM has, here found an Interesting one
that allows you to control your radio over the Internet !

An off topic question:
Does anyone knows a page for the YAESU VX-1R and or VX-5R
Info and mods ?

Hello Chuck, tnx for the reply.

It wasn't keyed down for 25 min, just a normal qso, tx/rx. I guess I shold of explained that better?
Any way, its never done that befor.
Both fans were running, blowing out hot air.
The fan (s) do make noise at the first couple key ups when the rig is cold, (after being off all night, or a few hours) but goes away soon.
Almost acts like something is hitting the fan blades, then warms up, and expands out of the way?

See what happens.

Mine got very hot before it went back to Yaesu to have the final replaced.
You might also check the load, (sorry for the obvious one, but I had to
say it - Hi HI).

I have been able to duplicate your Noise Blanker problem. I turned the radio on 20 meters this morning. The noise blanker was enabled. The receiver went very quiet, and had some sort of noise pulsing through the frequency. If I clicked the mike button, the problem cleared up. I tried this a few times, and could repeat this. I then turned off the noise blanker, and the problem went away. This all happened when the radio was set up on the base with a power supply. I would like to hear more on this problem.

Subject: [FT100] Can Anyone Duplicate This Bug

From: 2K-plus <twoKplus@...>

I posted a few days ago about a noise blanker bug I was experiencing. Here is what happens on my rig to make it occur (all this is done in the vehicle with motor running). Tune radio to 40 meters hopefully when it is a bit noisy. Set the noise blanker to 10 and turn the noise blanker function on with radio in LSB mode. Turn radio off and then back on. I experience a large reduction in S meter deflection and audio output. if I hit the PTT switch the radio becomes normal again. Also if I turn the rig off than on with the noise blanker disengaged the problem doesn't show up. I would be very interested if anyone else is experiencing this bug.

thanks,

Richard / N1VXW

394. Re: ft100 has it's problems (for now)

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-19 18:08:52 UTC
From: Walsh, Tom
Topic: 357 Message: 394

Regarding my 'problem report' after modification... I restored the factory configuration and verified that the behavior was the same with and without the modification. Operator error, sorry for the misdirection. The "select" knob is 10Khz fixed in SSB modes. The "main dial" can be placed in 1Khz by holding the step button. Note that the manual for my unit has an error in the description, stating that the "select" knob is the one placed in 1Khz by holding the step button.

Memory recall works as documented in the manual, both with and without the modification. Just have to chalk this up to my unfamiliarity with the rig...

Maybe someone who as *never* modified the rig can cross check on the SSB and "select" vs "main knob" behavior.

-Tom KB7EFZ

I'd stated:
>There are some S/W bugs. If I'm not mistaken, prior to modifying
>the radio to be capable of wide TX, the "select" knob could be placed
>in 1KHz step rate for SSB. After the mod, the main tuning dial is in

-----Original Message-----
From: Walsh, Tom [mailto:tom.walsh@...]
Sent: Friday, April 16, 1999 11:04 AM
To: FT100@onelist.com
Subject: [FT100] Re: ft100 has it's problems (for now)

From: "Walsh, Tom" <tom.walsh@...>

In the discussions of each problem (excepting the blown transmit rf amp), I think that each of the "it don't work" descriptions I've seen falls into either

a) RF in the shack / poor ground
I've seen my FT747 rig lock up (tx) when I had a terrible mismatch with a tuner (causing the feedline to radiate into the shack). The issue is simply that at some level of RF, the energy is going to get back into the control circuitry and cause odd / undesirable behavior.
I've seen my FT-100 rig with ATAS-100 be unable

to correctly read the VSWR and thus be unable to
correctly tune the antenna from a lack of good
RF (not DC) grounding of the radio. Use of a very
rudimentary (not very good) ground fixed that right
up. I'm actually surprised how well it works with
a really rotten ground. Some of the folks on this
mailing list have described the usual methods for
obtaining adequate grounding for HF mobile work.
They're pretty hard core... They didn't even say
nice things when I dedicated one small length of
ground braid to the problem...

b) other source of RF getting into the rig
The RX problem of tones in CW mode is consistent
with some other source of RF. Perhaps a neighbor
with a CB and a grudge against the world who left
a rig with a brick on the mic?

Not sure about the blown amp, but if memory serves, this amp was blown
during a "brick on the key" test, right?

There are some S/W bugs. If I'm not mistaken, prior to modifying
the radio to be capable of wide TX, the "select" knob could be placed
in 1KHz step rate for SSB. After the mod, the main tuning dial is in
that mode when it's selected, leaving the select knob in 10KHz, which
is very much too much for SSB, and sounds alot like 11m spacing...

The "fast" memory recall mode seems to be confused as well. Not sure
if perhaps I'm doing something wrong, will have to review the manual.

The CW peaking (audio dsp based) filter appears to not work correctly
for CW-R mode, although it could be (me) operator error. The 500Hz CW
filter works fine for this mode (opposite side BFO injection).

It is not possible, as is the case with each Yaesu radio I've owned, to
program different CTCSS encode and decode frequencies. Both TX and RX
have to use the same CTCSS code when using tone squelch. This is in
practice not a big issue, although an occasional repeater control op
will program the repeater that way due to ownership of gear which can
do this relatively unimportant thing.

The "memory clear" reset clears the memory keyer's memory. Not a big
deal, but unexpected by me.

The lack of automatic backlight dimming is a pain. The FT-5200 got this
right - automatic with manual override.

The radio is a really tightly packed device. It will not live long if
installed without adequate airflow. I tried the glove box. Not pretty.
Don't even think about it. If installing under the seat, be certain to
vacuum the area periodically and clean all vents on the radio. I'd sure
check the fan directions as well, since someone noted that their fans

got hooked up wrong (sounds like someone put the wires in the connector wrong?

Beyond this, most of the "complaints" I've seen are really nits. Lack of panel space dictates small jack for external audio. Need to drive speaker guarantees it's not at headphone level. The rig provides separate 9600 and 1200 baud digital mode hookups, CAT control, FC-20 and ATAS control, dual antenna jacks... Let's be reasonable. It's a fantastic radio with a few very minor bugs as mentioned.

>their customers. If you want some glaring examples of why this is so, I
>can provide them.

Alright, Chuck, thanks for "reeling me in". I guess my panic was that I have already bought the radio, haven't installed it mobile or taken an opportunity to try and transmit, and I'm waiting for the other shoe to drop. It did tap the floor the other day with the radio producing a constant

internally generated tone when in CW mode in receive. That effect went away the next day.

Still, there is a clear pattern on the list of transmit related problems locking on the air, poor output, ATAS not acting right, blah blah blah). And as I said, we did wait almost a year for it to come out.

And yes, I am unfairly grouping the problems reported in this radio with others facing problems on the VX-5R list. It's just that I have been using commercial gear quite a while and I'm just getting back into Yaesu, which used to be the "one and only" brand for me. I was concerned that quality has slipped but more concerned that since the evil computers have been foisted on us, we, as consumers have become more complacent. I tell ya, if the products I sell were as crappy as PC's (which OS is IRRelevant) I would be out of work, and maybe in jail.

I'm really glad to hear that yours is fine. And BTW, my Alinco went back for a warranty repair before I sold it to get the 100 as well! I'm also glad to be part of this community, and hope to contribute more than I learn as I get to know the radio in the next couple of months.

BTW, there is a "Yaesu Exit" from the JR Train station in Tokyo. Cool?

395. Got my FT100 and it is terrific!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-19 22:57:06 UTC
From: Raymond Makul
Topic: 395 Message: 395

I picked up my back ordered FT100 from HRO Delaware Friday, and got in a few hours operation. I must admit, after reading some of the posts to this list, when I first set it up and fired it up, I expected it to turn cherry red and go up in smoke. It actually stays quite cool, at least the way I use it on HF. When on 2 mtrs/440 at 20% power, the fans come on with each transmission. I assume it is programmed to do that, and not actually responding to actual heat buildup.

Likes:

The ease with which one can use the DSP band pass and adjust the high low cuts. Actually better implementation, in my opinion, than the MP.

The excellent audio reports I get.

The fact that I could get it on 75 meters and talking to my friends without even looking at the manual.

Operating split frequency on HF is fairly straight forward.

The flip up front feet.

The fact that they give you a mounting bracket.

Dislikes:

Having to constantly punch the step button to vary tuning rates. My TS-50 varies the rate depending on how fast you spin the knob.

The fact that extra filters are solder in, and not socketed.

Questions:

When hitting the up/down buttons, I get a band at 80 mhz. Is this unit set up for a new ham band? (Mine is a USA unit)

Also, I find no real documentation on the MH-36 mike that came with the unit.

Maybe I need to read a little more.

Topic: 396 Message: 396

I have had my FT-100 for 3 weeks now, and it works great. Current draw is between 10 and 15 amps with full power. I am getting good signal and audio reports. There seems to be a minor problem with powering the radio up in SSB with the Noise Blanker on, but not worth sending the rig back just for that problem. I have been using the rig both mobile and base with no problems. Will probably install the 6Khz filter to reduce splatter problems. I am new to the DSP filtering, and would like to get suggestions for setting the values. Thanks for your suggestions.

The fact that the filters are solder-in enhance the reliability, especially if you are going to use it mobile. Sockets make it easier to change them, but I don't find myself doing that too often.

399. ft100 problem

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-19 23:08:03 UTC
From: raisnman@xxxxxxxxx.xxx
Topic: 399 Message: 399

hello
i just tried the mod, and my 100 has the first space already unsoldered. or are they all that way , and i need to take out the next resisitor too?
now the mod does not to anything, as i've only taken the one off. It does not do the things it says it will do after i hold down the butts. and turn on the power.
any assist will be appreciated.
thanks
r.l.m.

From: Walsh, Tom
Topic: 396 Message: 400

An interesting side note - my FT847, when left with the DSP based notch filter on, eventually has the audio drop to very low level. Turning off the notch filter clears it up. I'd bet the DSP code "creates" notch filters, but never destroys them...
Pretty easy workaround, but a really un-nerving problem.
-Tom KB7EFZ
ps: I've not noticed this on the FT100, but it's so nice on mobile CW that perhaps I've not left the DSP Notch on long enough.

401. sep. cable problem

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-20 03:15:11 UTC
From: dale brown
Topic: 401 Message: 401

Has anyone had the separation cable attached and not been able to tune the ATAS100 or change from vfo to mem? I thought itmightr be RF geting into the cable. I put on three ferrite cores(radio shack) and still no help. Yaesu techsupport said to check grounding of antenna and to check cable for shorts or grounding. The cable checks out ok...full continuity from end to end and no shorts. When the face plate is re-installed on the radio, it works and tunes fine....Has anyone else had this problem? Dale KC2PZ

Yes, this clears up when you press the PTT. I also have a signal or spur that cycles through on a regular basis until I either turn the NB off, or press the PTT. This ONLY happens in SSB, not FM. (Haven't tried CW or AM yet) I noticed this on 20 meters.
Has anyone tried adjusting the parameters on the DSP filtering, and come up with suggested settings? I am new to DSP. Thanks

403. FT-100 VHF/UHF Amp problem

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-21 13:55:48 UTC
From: Chuck Scott
Topic: 403 Message: 403

All:
Well, looks like I have to send my FT-100 back also. I noticed last night when I connected my radio to the service monitor that it had very low output on VHF and UHF, about 1W and .5W respectively. It did have the mods done to it, but reversing them made no difference. Since I had receintly installed the AM filter, I checked to make sure none of the cables were loose, and they weren't. I checked the final and it was getting drive and supply voltage, but it was clearly not producing power. So, back it goes.
The interesting thing however is that I went to check on the spec for the finals and found that the SRF7043 finals (I think it's a vertical MOSFET) were nowhere to be found in the Motorola specs. I did find a reference to some other SRF's on the RF Parts, Co. site at http://www.rfparts.com/mototran.html with a caution that they are "aware of remarked transistors being passed off as genuine Motorola SRF part numbers". Makes me wonder if the production lot for Yaesu was contaminated with bogus parts. That's pure speculation, so don't get all carried away yet. It is however how these kinds of failures can come up in production when they didn't show prior to production. Needless to say, if anyone has any hard data on the SRF7043, please pass it on.
I'd have to say in looking at this part of the radio that I was impressed with the design and construction of the amplifier and filters. I'm also still very happy with the radio and intend to sell off my 706MKII once I get the FT100 back.

Chuck - N8DNX

This may have changed slightly over time. My unit required the
memory clear reset sequence (DSP + LOCK + PWR) to "sample" the
state of the configuration jumpers (replacing the sequence which
is described as resulting in "r on"). Remainder of information
is in accord with how my rig behaved. My rig also had jumper 1
not installed by the manufacturer. Note that the memory reset
init results in a cute display about "initializing" with a little
text bargraph. In any case, the reset left the menu settings
intact, which was nice (ARTS callsign programming, et. al.). Note
that this, unlike other Yaesu HW modifications, left "Automatic
Repeater offset Selection" intact for 2m/70cm. The need for a
reset is in accord with all other yaesu rigs I've owned, fyi.

411. Thinking of buying

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-22 13:18:05 UTC
From: markt103@xxxxxxx.xxx
Topic: 411 Message: 411

I have been away from the hobby for nine years
and am now looking to buy a radio (what happened
to the good old TS430 and FT290!). The IC706mkIIG
and FT100 look to be good choices and it is
difficult to choose between the two. I had a listen in the shop and personally thought the
FT100 was far superior on receive.

I would be grateful for any information from real
users rather than salesmen. My main interests
are cw on hf and general ssb/cw/fm use on 2m. 6m
did not exist when I last used the radio so this
will be a new experience as well.

Thanking you in advance for your help.

You know, hearing posts like that are a hoot ! "Are you sure the radio is turned on?" "Are you sure you pressed the mike key?" "Are you sure the power cord is hooked up?" !!

Joe, I know you were just meaning to help, you're one of the more knowledgable contributors out here. But I've had *two* ft100's fail, I just asked HRO and just this store has had 5 units go completely belly up, not including my two. The unit was announced a year ago at Dayton, and they are just now coming out with it - and that appears too soon.

Anyone seriously thinking about an FT100 should wait at least another 6-8 weeks, or around the
Dayton fest. It's worth waiting for IMO if you have the patience. But I don't, and went and purchased a 706MKIIG - and I've had a wonderful time with that rig. No complaints at all - and I use it on all bands, all the time, mobile and fixed. (when it's plugged in! lol)

Dear OM's

I live in cramped quarters. The FT-100 is, therefore, not only attractive to me because of its size, but also because Yaesu advertises the combination of the ATAS-100 Antenna together with the base kit ATBK-100.

Has anybody already made any experiences with that setup? Has anybody a picture and measurements of how such a setup looks like.

I don't know for sure, but I would expect to see a new ADMS2 version that includes support for the FT-100. That seems to be Yaesu's typical MO for memory configurations. I would then expect yet another version when the FT-90r hits the market.

From: dale brown
Topic: 420 Message: 420

An update in the continuing saga of the inability to tune the ATAS100 with the separation cable attached. I grounded the radio case to the transmission hump and the ATAS100 mounting bracket to the frame under the bumper...metal to metal...I even filed the paint off...Still cannot tune the ATAS100 with the separation cable attached. I then attached three extra ferrite cores to the cable and wound the cable through them....still no tune.

Yaesu tech support says to send back the cable kit....I decided to try the FT8100 separation cable....it looks the same....It also would not tune with the ATAS100 antenna....So....It is not the cable...I wonder if this radio is overly sensitive to RF in the control head?....Dale KC2PZ

Hi Mark,

I am familiar with the AM image problem on 10 meters. I have a FT-100 that I am using in a review for an American ham magazine and when I had it hooked up to a 10 element log periodic that received from 13-30Mhz I received many images on 10 meters. I identified 2 as coming from SW broadcast stations with broadcast frequencies at 15.665Mhz (WSHB in US) and 13.690 (Merlin Network One from the UK). I live in New England and European SW is very strong over here in the afternoon and evening. I have contacted Yaesu about this and am waiting for a reply.

If you would not mind spending the time I would like to know if:

1. You are using a tuner (I feel a tuner in line on receive may eliminate this problem).

2. What kind of antenna you are using on ten meters (resonant or broad band)

3. If you have identified the primary broadcast frequency of any of these AM stations.

FYI I have the optional 6Khz filter in the radio and it does not have any effect on this. In addition when I used the radio with a trapped vertical (R-7) the images were much attenuated but didn't go away. I currently have the radio installed mobile with an ATAS-100 and have not experienced the image problem in the car.

I would much appreciate any input from you or others who have experienced 10 meter imaging. By-the-way I have also experienced this to a lesser extent on 12 meters with the LPA antenna.

Thanks es 73

Hi Richard,
RE: Broadcast interference on 10m

The antenna is a 10m half wave vertical (cheap CB variety with no radials. I am also using a tuner. I have not been able to identify the source of the signals but I shall tonight check again and also try the antenna without the tuning unit. I rang Yaesu in the Uk who said that they have not had any calls about this but will pass the information to Japan for 'direct injection testing'.

Apart from this, what do you think of the radio. I purchased mine two days ago and tuned the above mentioned aerial for 20m. First contact with VE, second with K1. I have been away from the radio for nine years and so cannot compare the performance with another radio. I used to have a TS430. The Rx seems excellent to me (on 20m anyway) - I have listened to JA, K, VE booming in 5/9 and am sure I never heard things this well in the past.

432. humor in understanding the FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-27 01:15:06 UTC
From: Jack Kovar
Topic: 432 Message: 432

It is likely the two of the strongest signals in your area are over loading the front end RF amp of the receiver.
In work I do this is called the 3PI. Third Point intercept.
It is the point strong signals push the RF amp PAST its normal linear operating range.
Like Scotty of Star Trek Said: SHE CAN'T TAKE NO MORE SIR!
At this point the amp becomes a non linear device" know as a mixer".
Same process when mixing two strong rabbits together, they develop many off spring.
Put two signals into a mixer and you get out, two original frequencies, the sum and the difference of the two.
If the signals are really really strong they can mix again and you have a frequency SHAKE AND BAKE with all
sorts of mixing products to spit out.
If any of theses Shake and Bake, Rabbit mixing output products end up close to the first IF frequency or the original desired frequency, the barn door is open and your radio will try to demodulate it.
This is know as letting the salesmen in the house! NOT GOOD!

Here is a example of local problem for a local FM repeater on 146 MHz here in Cedar Rapids.
A high power TV station on 52MHz is located north of town.
A high power FM radio station on 94MHz is located North of town.
When people drive north of Cedar Rapids their radios buzz and chatter and can not hear the repeater.
52Mhz + 94MHz =146MHz of TV raster and some rock and roll.
See the concept!
The trick is reduce the gain on your receiver or FILTER OUT the strongest signal BEFORE it pushes
the receiver to 3PI, no mixing occurs.
Known as stopping the salesman at the front door.

So the question I leave you with: If you design a receiver to work on Broadcast bands, ham bands, everywhere band, How do you keep the salesman out of the house? If you leave the front door open they will come!

Tracking filters would be a starting point. Filters that adjust to the band you are using.
Hey! These filters take up valuable space fast in these little radios.
You think they might have cut a few corners on the filters for pocket fisherman size radios?

Lets talk a bit about front end Gain of the receiver.
In the mixing process two undesired "salesman signals" add their signals strength together.
When pushed you past your 3PI you go non linear on them! They have the edge

and it gets ugly!
If you can reduce your gain by 3db you can reduce there interference by
6db.
Reduce gain 6db and reduce interference by 12db. Cool Beans Right!

Remember this trick next time you go to purchase a car.
Keep the interfering salesmen separated and keep them from talking to loud,
which pushes you into 3PI and all Hell breaks loose.

This concept may work for Road Rage in larger cities, I have not been able
to prove it here in Iowa!
I have heard of people addressing a "third pointing intercept finger" 3PI,
that develops when pushing people nonlinear in heavy traffic.

Happy trails,

Jack Kovar

433. Re: humor in understanding the FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-27 11:38:29 UTC
From: Chuck Scott
Topic: 432 Message: 433

Jack:
If I'm correct, the IPO (Intercept Point Optimization) mode on the
FT-100 and other Yaesu rigs eliminates the RF amp and significantly
improves the receiver's strong signal handling. Also, while listening to
my FT-100 prior to installing the AM filter it appeared that the ultimate
IF rejection wasn't adequate to fully reduce off frequency signals. I
think I was hearing signals that were nowhere near the input frequency but
not with the IPO mode, which reduces the signal levels quite a bit.
Unfortunately, my radio is at Yaesu right now and I can't run the tests on
it to see how it is with the AM filter, but I think it was better after
installing it.

From: 2K-plus
Topic: 427 Message: 434

Hi Mark,

Thanks for the information. I spoke to Yaesu again about the 10 meter breakthrough problem today and let them know I only had 2 weeks left till I had to turn in my article. They indicated that they would get back to me soon and that there were a number of people there today from Yaesu Japan.

As far as my general opinion of the radio I am quite impressed. The layout of the menus is logical and the functionality of the radio is quite amazing considering it's size. I have had very good audio reports (although my mic seems a bit sensitive to breath noise). The receiver seems quite hot and when I put the radio in a mobile environment with the ATAS-100 antenna I was very happy with it's performance. On a one hour trip last week I worked the Oscar 27 Satellite, and 3 different continents. I have also worked the RS-13 from the car and been able to maintain 40 minute rag chews with stations here in the states and DX on 20-10 meters.

Hope you are enjoying your new radio and I will keep you informed about any info I get from Yaesu.

435. 10m performance

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-28 08:28:38 UTC
From: Mark T
Topic: 435 Message: 435

Hi,
Checked 10m last night. The images were too weak to identify and switching IPO did remove them (not sure exactly what this does - need to read the manual!). This being said, I did make contact with Argentina, Brazil and Bosnia in glorious stereo sound!

436. Strike Two

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-29 02:54:26 UTC
From: boux@autobahn.mb.ca
Topic: 436 Message: 436

Hello everybody...

I just purchased the FT-100 on the 16th of April.
The radio lasted just 2 hours before it went up in SMOKE !! I was on the 2mtr ssb (144.2) at 100%
power in a rag-chew with some other people when the radio lost all receive/transmit. Just like somebody turned the rf-gain slowly off to where you had no singles anymore. When I tx. there was nothing also SWR warning came on. I take it the PA section went. SWR on my 5/8 2mtr. is 1.2 .
I found the radio got REALLY hot before meltdown!!
Round Two.
I sent radio back and contacted Yeasu about meltdown. They asked if i put any options in radio. I had installed all the options. Very difficult and time consuming! Yeasu said that they were having problems with the ribbon-cables.
+9/-9 volts side-by-side, could cross if not put-back right. You-see you have to dismantle the stupid thing to solder the filters in. Any-way I as really careful installing the options and don't really know if that was the problem with the 1st radio, so be careful!!!

Radio #2 is still working as of this mailing.
but i'm returning it because it to runs way too HOT!!! I get temps of 106 f. just on receive in just 45 min. from cold. And 140 f. after 10 min. of talking on 2mtrs. at 10 watts. This radio is going to burn-up like the first on if I keep talking, so I'm going to return it for an Icom 706G. Something to note though, I noticed that the fan won't stay on constantly on the 2 mtr./70cm. section. The fan will run only when you transmit and for about 7 seconds after you release the PTT. But will shut compleatly down there-after regaurdless of temp. of radio. In otherwords will melt-down eventually because fan won't regulate temp. I think theres a problem here worth noting, maybe in the control circuit for vhf/uhf. This will-not show up on 6mtr. and down. Try it. switch between 2 and 6 meters when the radio is pretty warm and you'll know what i'm tryiny to say here. Yaesu said to me they will look into the complaint, but have not had many problems with the radio. Sure they have'nt.

Other then that I was NOT impressed with this radio. I also noted no indicator for SWR like manual says. Lots of typo's in manual. Options section for tcxo install wont tell you, you have to remove the ref. board first, than install the tcxo inplace of it. In a nut-shell "REALLY BAD OPERATION MANUAL WITH LIMITED INFO ON RADIO FUNCTIONS".

DON'T BUY THIS RADIO YET!!!

Wait till all the bugs are out of it. To bad I could'nt wait, its cost me already 3days work and 100 in gas driving 3600km with this radio. Should have bought the Icom in the first place. Its been around for awhile, and the bugs are gone. (I hope to God).

Hello again...

Just to let everybody know...the modification for the FT-100 frequency expansion said that you have to un-solded R-6035 and R-6036.
On the two radios I had, only R-6036 as there.
R-6035 was already gone from factory. The mod will work fine as listed on the net.

I am curious, were you using your ft100? Were you mobil or as a base rig? How much clearance did the radio have on all sides? How much voltage and current were available?

Reason I ask is that I have noted that this radio really really sucks the juice! The manual clearly says it need 13.8 and I can't remember if it was 20 or 25 amps of current. They are dead serious about the 13.8 volts.

On 2 meter fm at 100% power I could not transmit on frequency unless I had engine started or had rig in house on a 30 amp supply. I have had 30 minute qso's with the rig on several occasions. Rig got warm to touch but never
as hot as you experienced. Fan runs allot on my unit, never had the noisy fan some people claim. I live about 1/4 mile from the local 2 meter repeater. I get S9 + 20 reading on signal strength from home. Other brand rigs say +60 from this location. However if I get any closer to repeater I do get +60 reading on ft 100. I have not experienced the images some of the other stations have reported.

I do think the manual could use some more work, but I have pretty much figured the radio out after just 12 hours of use. Have used the radio a week now and am happy with it.

Hi

Got my FT100 - finally!!

However I have one problem. It seems that my 1750 HZ burst for opening repeaters is too higt i frq. Whenever I try to activate one of our local repeaters with the burst nothing happens. I've tried to listen to the burst with another rdo and it 'seems' like frq is higher. I can only access the repeater with the ctcss tone (82,5 in OZ-land).

Is it possible to adjust the tone in one of the menu's ?

I'm very curious about current consumption on 2m. I got my (second) rig a day or so ago (first rig was U/S on delivery) and 50W O/P used some 7A or about 96.6W @13.8V input. This is approx 50% efficient which I'd guess is pretty normal for FM, considering a linear PA. I haven't measured the current on sideband (it should be similar), I just noticed the current on FM. 16A sounds ridiculous to me.

My rig has only had about 90 minutes twiddling so far but was pretty cool. The radio in the shop was pretty hot - it had been on all day. This doesn't give me much faith when the set has been in the car all day. Een Britain gets hot sometimes.

Cliff

I've had my 100 for three weeks now, hoping nothing like yours happens. But there is a swr meter on it, when you switch the mtr button it goes from alc to swr. So that little line you see for alc now is swr. I know there is no scale, (not real good) but it is a indication.
Mine has been working perfect so far. I think this is a very good radio, I'm a rural carrier, and I'm mobile all day long. this radio is easy to use and is loaded with features you won't find in other radios. I use mine on 2m and 440 everyday full power FM. Really I'm testing to see if mine goes south (while under warranty). I will check on mine to see about that fan. Thanks for the info. Mike KF8MY..

You'll probably find that your toneburst is at 1800Hz (US standard) All the radios in my local shop were sent back to Yaesu to be altered to 1750Hz. I'm a little surprised as the programmers amongst us would generate the tone in software!

I have had my ft-100 only about 5 days. Made first 432 ssb contacts
last nite during sprint contest.

I found an annoying birdie at 432.080. Strong enought to heard easily.
No s-meter indication. It this present in all FT-100's

Intalled radio loose on front seat. Clip leads to cigrette lighter.
(great installation, I know). Had reports of FMing on ssb. Started
car and got good reports. confirms radios need for good (not low)
voltage. Could be a bit of a bummer if I go roving and have to keep
car running to make contacts.

Still learning my way around menus. Radio sure in feature rich. Hard
to operate. Damn freq knob gets bumped every time I try and change
function.

My select switch doesn't feel right either. Seems to be 'loose' and
jumps if wiggled.

Radio has 'ruined' shopping at hamfests. It has/does everthing.
nothing left to buy! hi!

Hello FT100@onelist.com!

I've pretty much decided on the ft100 as my first ham radio. I am a bit concerned about the posts regarding these radios failing to work within a short period of time, but plan to make the purchase in June. Perhaps by then they'll be on their second production run and the bugs will be out?

IN any case, I'm very new to all this, and some of the ad material is not very clear to me. The plan is to mount the ft100 in the car, and also use it inside the house as a base. My first question, to use the ft100 with the atas100 antenna system through all bands, does one also require the fc-20 external antenna tuner, or does the atas100 also accomplish the tuning on its own?
Many thanks for replies to what is probably a dumb question.

Hi Robert

Just got mine yesterday. There are no birdies on 432.080 on mine. Checked the hole band on 70 cm ssb/cw but nothing showed up.

It is a great rig (so far) even though mine aparently came with a 1800 HZ burst tone (US standard) when I need a 1750 HZ...! Amazing that U cant change that via the menu system.

I don't have any trouble with a non-scale SWR meter. It is "relative"
anyways... I'm much more concerned with the "reflected power."

It's really a shame he got such a bad rig. I feel lucky, so far. I only
used the original 706 and was unimpressed - especially with the menu
system. I really DO wish Yaesu had copied the 706's abillity to send CW
with the UP/DOWN microphone buttons - that's too cool.

Hi William,

The FT-100 runs a motor in the ATAS-100 that adjusts the antenna for frequencies of 40 meters to 70 CM. By doing this there is no need for an external tuner. Yaesu makes a base kit for the ATAS-100 that I haven't seen and a quick disconnect mobile mount for the radio so if it isn't too complicated to hook up the ATAS-100 base kit you could conceivable change the rig and antenna from house to car without too much trouble. If you plan to use a fixed antenna other than the ATAS-100 at your base location you may need to look into a tuner depending on what type of antenna and what bands you operate on.

Hope this helps,

73

I was using a dualband 2m/440 antenna. Could barely hear one local station. Tried all
the modes including wfm with same results. Seems like a problem in the front end. Anyway it's at
Yaesu now. I noted this problem also. Will see when it comes back.

Just wanted to say that I have an FT-100 and I love it. I bought the ATAS-100 antenna with it and use it in my Ford Explorer. GREAT RADIO!!!!
Some of the useres in the FT-100 group get carried away. I hope that they creat "I shoulda bought an ICOM" group for those crybabies.
I also own a FT-1000MP. I remember when a lot of people cried wolf about how bad the FT-1000MP was. Most of the complaints ran about the same at the FT-100 complaints. Manual too cheap, components too cheap, etc. etc. I do think that any radio will fail a certain percent of the time. Static electricity is deadly to electronic devices in most cars. Do some of these users who have failed radios get static when getting in and out of thier car?
I read "connected to a cigartette lighter", the instruction manual clearly says to connect it directly to the battery...
Arrgh... If you were willing to put that big of a chunk of money out for the radio, then you already had a good idea about the companies reputation being top notch with the amateur community. If I owned a boat, motor home, or another vehicle, I wouldn't hesitate to put another FT-100 into it as well.
With only a few hundred readers on this group so far, I dont think the handfull of complaints I have seen here would change my mind about the product. And if it does break, you have one of the best warrenties in the business, extremely fast factory turnaround, and long term service programs, that will still be here 10 years from now. Not the old "we dont support that product any more"" stuff other companies tell you. I am proud to be an owner of the YAESU FT-100. No I do not work for Yaesu or any other Amateur Radio company. I am just a satisfied customer.

I think crybaby is a strong word for the folks having problems with their radios.
I have heard of other reports on the air other than the ones posted here. In my opinion
Yaesu has major problems with this rig. A friend of mine and I got the radios at the
same time. His had an audio problem out of the box. I already had mine installed mobile
and it was working fine. Plugged his into the same installation and it had the audio problem.
Mine lasted two weeks when the SSB, CW, and AM modes went dead. FM was still fine.
I ordered my 100 last year, got to use it two weeks, had to pay $30 to ship it back
to Yaesu and now have to wait two to three weeks to get it back. Meantime I'm missing
all the 10 meter fun which is the main reason I bought the rig. I think I as well as others
on this list have a legitimate complaint.
Richard....AA4KS....
P.S. When your 100 breaks, be sure to let us know how it feels....

452. Strike three - it's out

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-29 16:46:45 UTC
From: radio
Topic: 452 Message: 452

Here's some of my observations before I traded my FT100 for a mature 706G:

1) The tuning knob is way too small to spin well, and the finger indention is very shallow, and does not have it's own bearing like the 706. Just an annoyance (continual).
2) The FT100 filters are superior to the 706. In fact, the 706 has a hard time with rejection during certain band conditions
3) The FT100's manual is an absolute joke. Many, many ommisions, you're left to assume and guess at many of its features. That's a first for Yaesu.
4) None of the knobs and buttons are back lit. Another annoyance, but this time a real nussance as one gropes around inside a dark, moving auto for the right button. Plus it kills its looks.
5) My Ft100 overheated, smoked and shut itself down on 2m. A brief rest period and it was working again.
6) Refused to tune the A100 antenna. After tune failure, the FT100's transmitter the shut down permanently in all modes. A 2 hour power off followed by a hard reset got the xmitter running again.
7) Another tune attempt left me with #6 again.
8) The FT100 is markedly smaller than the 706. Maybe as much as 1/3 ?
9) HRO maintains more than 25% of their inventory of FT100's has been returned for refunds. They expect the # to approach 50% in short time.
10) I've got a adjustable power supply, and the rig shuts down on xmit with power <> 13v. It also drew 20amps ? That can't be right.
11) Why are the fans so screwey? Loud, run backwards etc.
12) I got some harmonics on 10m, from what appears to be from strong 40m qsos. Go figure. Notch did not remove it.
13) Receive on the FT100 is much broader than the 706 - about 200m all the way to 1ghz. Perhaps there's a mod for the 706?
14) The FT100 has a DTMF mike, unlike the 706. But if the rest of the radio is a bust, it doesn't much matter anyway.
15) Yaesu announced the FT100 before Dayton of 1998 (more than a year ago). It first shipped in early April of 1999. What the heck were they doing all that time?
16) The FT100 has no computer interface that I know of. 706 has 2.

Sorry guys, Yaesu has screwed the pooch on this one. It's gotta go back to the shop for another year I suppose...

>Hello everybody...
>
>I just purchased the FT-100 on the 16th of April.
>The radio lasted just 2 hours before it went up in SMOKE !! I was on the 2mtr ssb (144.2) at 100%

>power in a rag-chew with some other people when the radio lost all receive/transmit. Just like somebody turned the rf-gain slowly off to where you had no singles anymore. When I tx. there was nothing also SWR warning came on. I take it the PA section went. SWR on my 5/8 2mtr. is 1.2 .
>I found the radio got REALLY hot before meltdown!!
> Round Two.
>I sent radio back and contacted Yeasu about meltdown. They asked if i put any options in radio. I had installed all the options. Very difficult and time consuming! Yeasu said that they were having problems with the ribbon-cables.
>+9/-9 volts side-by-side, could cross if not put-back right. You-see you have to dismantle the stupid thing to solder the filters in. Any-way I as really careful installing the options and don't really know if that was the problem with the 1st radio, so be careful!!!
>
>Radio #2 is still working as of this mailing.
>but i'm returning it because it to runs way too HOT!!! I get temps of 106 f. just on receive in just 45 min. from cold. And 140 f. after 10 min. of talking on 2mtrs. at 10 watts. This radio is going to burn-up like the first on if I keep talking, so I'm going to return it for an Icom 706G. Something to note though, I noticed that the fan won't stay on constantly on the 2 mtr./70cm. section. The fan will run only when you transmit and for about 7 seconds after you release the PTT. But will shut compleatly down there-after regaurdless of temp. of radio. In otherwords will melt-down eventually because fan won't regulate temp. I think theres a problem here worth noting, maybe in the control circuit for vhf/uhf. This will-not show up on 6mtr. and down. Try it. switch between 2 and 6 meters when the radio is pretty warm and you'll know what i'm tryiny to say here. Yaesu said to me they will look into the complaint, but have not had many problems with the radio. Sure they have'nt.
>
>Other then that I was NOT impressed with this radio. I also noted no indicator for SWR like manual says. Lots of typo's in manual. Options section for tcxo install wont tell you, you have to remove the ref. board first, than install the tcxo inplace of it. In a nut-shell "REALLY BAD OPERATION MANUAL WITH LIMITED INFO ON RADIO FUNCTIONS".
>
>DON'T BUY THIS RADIO YET!!!
>
>Wait till all the bugs are out of it. To bad I could'nt wait, its cost me already 3days work and 100 in gas driving 3600km with this radio. Should have bought the Icom in the first place. Its been around for awhile, and the bugs are gone. (I hope to God).

453. Separation Kit!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-29 16:53:39 UTC
From: Paul R. Valko
Topic: 453 Message: 453

I ordered the $71.95 separation kit from R&L's web site yesterday morning and UPS delivered it today!

There is a LOT of stuff in there. The head-cable, a microphone extention and coupler, a remote speaker extention and coupler, and a mounting head bracket as well as the hardware!

Well worth it. I was going to put the rig under the front seats but now I think I'll stick it in the trunk (with a 12v fan) since all the cables came and they are long enough to make that happen.

I only wish there was a "quick-release" to the head cable, so it was easy to take the rig in and out of mobile service and use it in the house as a one-piece box. That was a shortcoming with my FT-900at and I'd have thought Yaesu would have solved that annoyance in the 100.

Seconded.

I'd have to have more money than I do to get away with buying another, though :-)

I own the first 5w dual band h/t (FT727R), and can still order parts for the radio. I used to own the old multiple deck single head remote VHF/UHF FM rig (cannot remember the number) which used a pretty fragile PLL chip. The rig had been out of production for about 5 or 10 years when I bought it used (in parts, from several different hams). I was able to purchase several of the PLL chips from Yaesu cheaply, even tho the company that made them had discontinued them several years prior. Yaesu parts did warn me that they were down to only a few of the PLL's left though... Pretty darn good support, IMHO.

BTW: haven't had a lick of problems with my FT100. Concur on not liking the way the "select" knob responds, could be fixed in S/W, but Yaesu is historically a taste weak on S/W. My FT100 is connected to the battery by a short run of 10ga stranded wire, and grounded to the floor of the car by a short run of ground braid. The SWR meter provided is *more* than adequate for mobile tuning. I could hand tune an antenna with the provided metering. Not sure why someone thinks that they need a scale. The object is to obtain a match, not to measure how bad a mismatch is...

Gotta stop, have real work to do in order to be free to play with the really excellent radio I bought...
-Tom, KB7EFZ
ps: got excellent reports again on 2m SSB and CW during Tuesday net...
pss: there'd been questions about minimizing standby current. I've measured 1.2a with display at dimmest, audio squelched, and tuner off. Pretty typical for rigs with lots of CPU. Current jumps about 250ma when DSP is enabled, not sure how much is extra CPU activity vs LED...

455. Tests

Yahoo group: FT100 (1998 — 2000)
Date: 1999-04-29 18:37:47 UTC
From: Duke & Ila
Topic: 455 Message: 455

For anyone that's interested, I made the following tests on the FT-100 I received from Burghardt Radio on april 1 1999.
I was using the following equipment
A 30A bench supply with 13.8V at the plug terminals on the FT-100
A Bird watt meter, and a 50ohm Bird dummy load.

On 443.300 with the transmitter on continuos in the FM mode for 5 minutes, the output was 21 watts and the transmit current was 7.9 amps. At the end of the 5 min period the transmitter temp was 96 degrees had maintained that temp for the last 3 minutes. The fans ran at slow speed for 1 minute after the transmitter was un-keyed, and the temp dropped to 94 degrees.

On 144.200, the same test was make with the transmitter on for 5 minutes in the FM mode. The output was 49 watts and the current was 20 amps
At the end of the 5 minute period the transmitter temp was 110 degrees and had maintained that temp for the final 2 minutes. After the transmitter was un-keyd, the fans ran at low speed for an additional 4.5 minutes and the temp dropped to 94 degrees.
I don't know if the above is normal or not, but when the fans are not on and in the receive mode for about 2 hours, the cabinet is barely warm to the touch. This was in the workshop at room temps.

I have the 6kc filter installed, and it sure works great on AM.

The above is for comparison only, and other FT-100's may have different readings.

Duke, w9gdw

I agree Paul, I have no problem with the swr meter not having a scale.
But I don't understand about ref. power meter? If you have more ref
power that scale is higher, so you can measure ref. power from the
meter. Swr, reflected power, isn't it the same relative thing?
I, so far enjoy my 100 very much. I feel for the people that got bad
ones. I did notice in wfm my receive is quite low compared to fm.
Receiving broadcast audio in the 71mhz range, I get S-7 signal in fm and
can just hear the station in wfm. And I think that is understandable.

Radio(?):
I'm sorry you're not happy with your FT-100 or Yaesu. I would agree that initial problems with a new model are frustrating. However, if this bothers you, please do yourself a favor and don't buy a radio until it's been on the market for a year or so. On the other hand, if you like having the latest technology, you don't mind dealing with some initial production problems and most importantly you're dealing with a company who's willing to stand behind their products and make them right, then new offerings can be very rewarding.
My experience with Yaesu on a number of issues has always been positive. I can't say that about either Kenwood or even Icom. In the case of Kenwood I got one of the TH-79A's (not the "AD") that was missing important features that were advertised for the radio and Kenwood refused to do anything about it till they realized that they were about to be dragged into court. ICOM also dissapointed me by refusing to acknowledge problems with an earlier HT battery till they were openly embarassed at the Dayton Hamvention. While I would never put ICOM in the same class with Kenwood regarding customer service issues, I think they still have a ways to go to gain the reputation Yaesu has.
I personally own an IC-706MKII which I've used while waiting for the FT-100. Even though my FT-100 is currently back at Yaesu for VHF/UHF final problems, it was abundantly clear that the radio was significantly better than the 706, at least for me. A few clear examples are the almost useless noise blanker on the 706, the fact that the DSP on the 100 is significantly better and the VHF/UHF functionality of the 706, particularly related to using it with repeaters, is in a word sad.
My suggestion for you is to ride out the initial problems with the FT-100. If that's a problem for you, admit it, but to say that Yaesu "screwed the pooch on this one" is in my opinion a ways off base.

Sure... I think the idea is to tune your antenna system so that the
"SWR" bars on the FT-100 DO NOT light up. :-)

I own one of the MFJ antenna analysers. Neat toy. When I put a 15M
"stinger" on my Comet HF-CV antenna the other night, I "tuned" the 15M
stinger just by using the FT-100's "SWR" meter.

Hallelujah..the "no-tune" problem with the separation cable installed has been fixed. No amount of grounding helped. So, I made a ferrite donut out of an old TV tube focussing ring and wrapped it with fiberglass tape. I then added three feet of coax wrapped 4 times through the donut at the base of the ATAS100. Shazammm.....it tunes. Now I can put the radio body in the back seat floor..... Dale KC2PZ

I agree Chuck, Yaesu has always had great service and will stand behind what they sell..
I owned a T-8A Icom HT that the battery clip broke 6 times in four weeks of owning it. Three friends who had new 756s that went back in the first month, all with the same problem. I remember the 706s not getting type acceptance right away because they were dirty. So no company is with out problems. I'm sure they'll work it out.
I'm interested in someone who has the new 706G for comparisons?
Please let the group know. 73s Mike.KF8MY

461. FT-100 Problems...

Yahoo group: FT100 (1998 — 2000)

One of the guys on the repeater last night was discussing the FT-100 and the seemingly endless "problems he has heard about," with the rig.

I frankly don't think there are any more or less troubles than any other radio has ever had.

What I think we see is the magic of the internet and email and electronic do-daddies giving us the ability to READ MORE about EVERYTHING, as it HAPPENS. All at the speed of light.

This is certainly not intended to make light of anyone. But I believe that one negative email can multiply as it gets forwarded to newsgroups, email lists, and web sites. Then gets read on the air. Then the next thing that happens is some guys on the air are talking about it, it gets overheard and retalked about on another frequency. Finally it's retyped as an email with the catch phase, "I heard..." It's an endless, vicious circle.

Here's to hoping my (and your) FT-100 doesn't bite the dust now, or after two weeks, or ever, for that matter. If mine should though... you will read about it - and I'll be sure to tell every possible detail of the event to help us all understand what, if anything, is going wrong.

Dear William,

I have had my rig now for over a month and would buy another one in a moment. *** I might just do it at Dayton!*** I have owned a Ft-900 CAT and have operated a Icom 706. I have ragchewed on 2 meters and worked DX on HF. I own a Ford Explorer and the DSP is very *** VERY*** impressive. I have not had any problems with this rig and have had nothing but fun. Keep in mind that any manufacture may have problems, it also may be the fault of the instillation.

I operate a Yaesu FT-1000mp from my house and I have been very impressed with this rig for comparison. I knew when I went into this that I would be getting leading edge technology and that I may have to have it sent back for mods. I operate CW mostly and think that they have done a fine job. If I have a problem, I will send it back to have it fixed, but it will still not change my mind that I feel that this is a great radio.

Hi all:...I've been on this list now for about 2 weeks and it appears that the number of radios having problems are substantial. I had thought of selling my IC 706MKII, but I'll wait another 6 months for the debugged 100. I've read reference to over 200 on this list now, so it would be interesting to know how many actually have FT-100s and how many have had problems....Is there an easy way of doing a poll? Maybe everyone could send a yes or no to the list owner??? When the 706 came out I heard nothing but negative talk on 2mtrs about this radio, but that didn't seem to deter the masses from clamoring to buy this radio. I guess you take your chances and have to expect the 10-20% failure rate that I've seen quoted for new out radios. The profit margins must be quite high to run a business and have this kind of return rate. The internet is a great medium to hold these companies accountable for their poor designs and failures and I would bet that led to their long lag time to put this radio into service. I have had nothing but good luck with Yaesu and will continue to buy from them, but now I will think twice about it. Keep up the great info. and dialog. Thankyou Kent K7CAR

Thankfully, my FT-100 is working fine and running cool. However, about 5 weeks ago I sent my FT-1000MP in for service to Cerrittos and was told the back-up was 5 weeks. As of Monday, I was told my unit had not yet had a technician assigned, and it could be as long as 8 weeks.

I wonder if delay is due to Yaesu assigning resources to turning around FT100 units as soon as possible during this initial distribution period.

Hallelujah..the "no-tune" problem with the separation cable installed has been fixed. No amount of grounding helped. So, I made a ferrite donut out of an old TV tube focussing ring and wrapped it with fiberglass tape. I then added three feet of coax wrapped 4 times through the donut at the base of the ATAS100. Shazammm.....it tunes. Now I can put the radio body in the back seat floor..... Dale KC2PZ

Yes Tom, but dual grounding at the antenna and at the radio did not
help. I removed the ground on the radio and put the ferrite core on the
end of the coax next to the antenna and it worked. Dale KC2PZ

Does the balun get hot at all? It would be worth checking the field strength from the ATAS if you can. I had a similar problem with an SGC smart tuner in the car. I tried many, many methods to get it going, correct earthing was the only real solution otherwise the rf simply got back into the electronics, or was wasted as heat.

Mind you if it works, it's legal!

Cliff, G4PZK

474. FT-100 mods

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-01 12:18:40 UTC
From: Cliff Bryant
Topic: 474 Message: 474

I've read about the extended TX frequency mod. Does anyone know the potential downside of this? The IC706 also has an extended TX mod but if you transmit at some frequencies you can blow the output devices up! You also violate your licence as well of course. Does anyone know if the unit is able to transmit on 4m (70MHz)? The FT-847 is able to run about 10W at a very poor efficiency on this band. I've heard that later models can actually run properly.
I guess that the filters have been redesigned for this purpose.

This page has information on the VX-5, FT-100, and way too much other stuff-
takes a long time to load. But there was one thing:

...The DSP noise reduction is amazing. The menu setting for the noise
reduction go from 1 to 16, it should go from 1 to Ford.

I laughed so hard I almost fell over

Ray,
If it's an HF rig and is not an FT100, YOU BETCHA!
I had an FT890 that was FMing and then refused to lock in there for 3 months. It came back scratched, the repair lasted a week, and has been back there for over a month.
I have been in the service industry for 30 years and have seen a few problems. I wish my favorite radio company wasn't having them.
John, the service manager is very friendly and probably could use some imput on this subject.

Maybe you got a bad manual -- the computer interface is clearly documented
in my manual. (Or maybe you missed the connector labelled "DATA"?)

Sorry you didn't like yours. Hope the 706G is mature enough for you
(though from what I've heard, you'd better hope some of the maturity was
applied to the noise blanker).

The only omission that's caused me a problem is the description of the BAND DATA pigtail. It refers to internal connection CAT/TUNER or LINEAR but I can't any details. Also when the LINEAR option is chosen what do the BAND A,B,C and D outputs refer to frequency wise? I'm trying to figure out a method to switch my 2M linear in the car on 2M only (or at least not when on an HF band)

Otherwise: good luck with the mature IC706. If it's mature why add 70cm as an afterthought? I have an IC706 MK1 and it's a great radio, the blanker is very poor I must agree, also the FT-100 is MUCH MUCH easier to use.

Anyway you pays your money and takes your choice! Good luck!

479. Low S-meter readings?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-01 22:15:33 UTC
From: Russell Finn
Topic: 479 Message: 479

I've seen a few references to the FT-100's S meter reading low, both on the list and on Usenet, but nothing really definitive. Since this is the main issue I have with the radio so far, let me take the opportunity to describe what I've seen:

Most of the time the S meter peaks out at about an S7 on 2m and about an S5 on HF. I have never seen it read full scale anywhere. I can't tell whether there's an actual problem with the sensitivity, or else the meter's just reading low. My experiences on HF have been slightly disappointing, but from what I hear the conditions have been poor lately anyway. I've had no problems on 2m.

VHF example: Driving down the highway less than a mile from a certain repeater site, I get an S7; if I'm closer to home, and farther from the site, the reading goes to about an S1. On my old TM-221A, the equivalent readings would be full scale (S9+60dB) and around S7-S9.

HF example: Driving home Friday I heard a really strong signal around 14.210 with a mini-pileup; I looked down and the S meter was about S5. I was surprised when the station identified itself as 4U1WB in downtown Washington, DC, running a KW into a big antenna -- because I had just crossed the District line into Maryland. He had a big loud signal, OK, but surely it should have been more than S5?

I've checked into ECARS a few times in the morning, so I know I've been heard in New England and Florida on 40m. I've also been heard in France on 15m, but that operator asked "the mobile station" to stand by, then never came back to me. Other than that and a couple of Marconi Day QSOs from my driveway, I've mostly been listening on HF so far.

I have the FT-100 on my front seat for the moment while I figure out how to mount it permanently, so there isn't a direct ground from the chassis -- nor is the ATAS-100 specially grounded either (although it's had no trouble finding matches on any HF bands). Could this be an issue?

For a lark I tried holding down the A/B/C keys on power up and checked the extended menu settings (as mentioned on the mods page at <http://www.ns.net/~rtwod2/ft100.htm>; S07, the "S FULL SCALE" setting, was 190 for me (instead of 144 for John), but adjusting it seemed to have no effect.

Any ideas from the list would be welcome. I'm not looking forward to sending it in for service unless I'm sure there's something wrong.

73, Russ, WA3YSW

From: 2K-plus
Topic: 479 Message: 480

Hi Russ,

Conditions have been really bad here in New England the last week and I don't know how long you have had your rig but I was thinking almost the opposite about my S meter. On HF it almost seems too sensitive. I have talked to quite a number of stations while mobile with the ATAS-100 antenna that came in S 9+. I had a conversation a few weeks ago with a station in Moscow and he ranged 10 to 20 db over for 20 minutes. To be honest I live in a rural area and most repeaters I hit are not full quieting and so I real don't watch the meter on FM but I have worked the AO 27 satellite on FM from the car and it has had a S-7 signal. So... you might try hooking the FT-100 up to an antenna with another rig and not only compare S meters but also how strong the signal sounds. I found that in the shack the FT-100 was not left far in the dust by my FT 1000mp on sensitivity so yours should stand up OK to other rigs A/Bing on the same antenna. If you try this at least you will be able to tell if it's a rig sensitivity problem or a S meter adjustment.

Hope this helps,

73

Topic: 479 Message: 481

I have a FT-1000mp and a FT-847 and the 100 reads on the S meter right with those two rigs. And I might add sensitivity is right there also.(without the pre amp on,on the 847) I am wondering if you have the IPO on or ATT on or maybe there is a problem there. Might want to compare to another rig with a weak signal to see if its just the S meter or a receiver problem. Hope you don't have to send it back. 73s Mike

My previous radio was an IC-756 (for the most part I'm and Icom user), I was amazed and pleased to find that the FT-100 DSP functions outdid the DSP on the 756! My Timewave 599 was very helpful with the IC-756 (voice mode) but is really not needed with the FT-100.

Hi

My F07 menu says 191 and my S-meter readings are not different from my FT1000MP (HF) or FT8100 (on V/U) - well almost not different...

I tried to change the value in F07 to 230 and it resultet in a change in readings for my local repeater from S7 to S9 (not scientifically compared). So I think you are supposed to experience a difference in your S-readings if you change the value.

By the way I asked the list some days ago abt changing the tone burst from 1800 Hz to 1750 Hz (EU-standard). I learned that some radios in G-land had to bee returned to Yaesu for that change. I'm just thinking if there is a setting/adjustment in the F-menu's to deal with that problem. Have any of you guys in G-land (or other) with a FT100 gained more knowledge concerning that issue?

Besides that I have had the chance to compare the IC706 'G' version with my FT100 on HF es 6M. I must say that there is a major difference in performance concerning the DSP - just glad to have the FT100...!

From: radio@xxxxxx.xxxxxxxxxx)
Topic: 484 Message: 484

I got a bad manual? LOL! Give me a break. No, my manual is good one, and has stayed out of jail so far. But the content still sux.
Oh, and if you would, please point me to the information for Yaesu's computer software to control the FT100 - the computer interface I was referring to (sorry - I should have said computer control software). Then again, I'd had hoped one could interpret same in a "broader" fashion. And yes, ICOM has two separate computer programs to control their radios - which I think both are more difficult to use than just working the front panel yourself.

True, the noise blanker is all one can complain about with the 706G. That's it. And yes, you'd sure as heck think that ICOM would have gotten their act together on this noise blanker thing over the last 2 years. Anybody with ICOM out here care enough to post a reply to that one?

>Maybe you got a bad manual -- the computer interface is clearly documented
>in my manual. (Or maybe you missed the connector labelled "DATA"?)
>
>Sorry you didn't like yours. Hope the 706G is mature enough for you
>(though from what I've heard, you'd better hope some of the maturity was
>applied to the noise blanker).

>73, Russ, WA3YSW

Cliff -

Adding 70cm is indeed what makes it mature. Unsure of your point here.

But there's one thing you FT100 die-hards are just really ignoring - the radio in its first production form is a disaster! Admit it! If you have one, and havn't had problems with it yet like most everybody else has, then you will.

The FT100 is a *much* more sophisticated unit than the 706G. But let's face it - Yaesu has lost over 40% of their key personnel over the last 2 years. I hear it stems from a managerial power struggle after Mr. Yaesu himself passed on a few years back. In any case, remember Kevin and his team that designed and saw through to completion radios like the FT1000 and the FT890? And backed up all their customers (including me) 200%? Those people are all gone. More simply put, I hear they were run off by the greedy infrastructure that surfaced within Yaesu U.S.

Every post of how great Yaesu is out here is nothing more than how great Yaesu *was* -- and I don't buy it. If Kevin's group was still around, not only would the FT100 never have been released in this disastorous state, it would have been released 12 months ago shortly after it was announced.

So, from what I hear about Yaesu's current environment, it will take them at least 6 months or so to fix all the problems with the FT100 at which time I will look at it again. You know, it looked good on paper, but...

Oh - BTW - anybody looked at a current production circuit board of the FT1000MP? I counted no less than 3 dozen wire jumpers. And I've heard that over 60% of all of the initial FT1000MP's were back at the factory at one point or another. I assume the rest never made it back cause owners just din't want to take the time to do so.

Again, I get back to my original point - I get the impression the company has significant internal problems. They design and attempt to produce superior equipment. After a certain period of time, this superior equipment matures and becomes usable. At which time I'll buy two. One for inside, one for my noise generator (Ford). But I'll be darned if I'm gonna get out here and gloss it all over cause of my years worth of anticipation and pride.

MUCH MUCH easier to use? I don't think so. 706G is just fine.

> From: Cliff Bryant <CliffB@...>
>Otherwise: good luck with the mature IC706. If it's mature why add 70cm as
>an afterthought? I have an IC706 MK1 and it's a great radio, the blanker is
v>ery poor I must agree, also the FT-100 is MUCH MUCH easier to use.

485. What a radio...

From: Mark T
Topic: 485 Message: 485

Had my FT100 a week now. I am sorry to hear about the problems some people have had but I have to say that I am amazed with mine. I have used it on HF, 2m and 70cm - still looking for an appopriate antenna design for 6m (any ideas?). I am still hearing weak breakthrough from am broadcast stations on 10m (any word from Yaesu on this yet!) and the S meter is a little lazy on VHF but apart from that I love it.

486. Receiver comparing with Spliters.

With all the S Meter talk I thought I would offer a tool here.

Motorola Receiver Splitters! 50 ohm input and four 50 ohm output ports.
Little box about size of three cigarette packs.
UHF connectors common on Motorola radios

You can have up to four radios hooked to one antenna and compare their S meter and receiver
performance.
No messing with Coax switches.
They provide a constant 50 ohm match up to 1 GHz.

Let me know If any of you find these a needed tool, I will try to work something out with you.

Yes... the "mast" section of the Hustler system is a 1/4 wave 6M antenna
by design.

Does it work WHILE the loading coils are on it?

Yaesu FT100 Frequently Asked Questions

PLEASE READ THIS FAQ BEFORE POSTING A QUESTION TO THE FT100 MAILING
LIST.

This FAQ is made from the archives of the FT100 mailing list based on
the OneList service. If you think something is missing, please forward
it to FT100@onelist.com and after it gets hashed out, it might make it
to the FAQ. Please address any comments about this FAQ to ny4i@....

Q. I have heard of several FT100's dying. What is happening to them?
A. Several users have reported the VHF/UHF final in the radio dying. The
radio
works perfectly except that the power output on 2m and 440 goes to
about 1 watt.
The radios were sent back to Yaesu and returned in about 8 days. (The
author of the FAQ
was has one of the radios).

Q. Can the radio be modified to transmit out of band?
A. Yes, it can. Check out http://www.ns.net/~rtwod2/ft100.htm for
details on the transmit mod.

Q. I can hear broadcast stations in places they should not be. SOmetimes
on
10 meters or on 10.0000 (WWV). What is wrong?
A. First, you are not crazy, or hearing things. Some radios do this.
Several people have
experienced this. There is not a solution to this problem yet. If you
experience it,
please send an email to Yaesu tech support and to ft100@onelist.com.

Q. What are some resources available on the web for the FT100.
A. You can check the FT100 archives on Onelist. Also, try
http://www.wm7d.net/hamradio/ft100/links/
as a website dedicated to the FT100.
```

Q. I am having a problem with the remote kit. Any ideas?
A. Some users reports problems with the remote kit. One solution was to put a
Radio Shack "wrap-around" torrid on the line.

Q. Whenever I tune on HF, the radio seems to stop receiving until I stop tuning the knob.
What gives?
A. This problem has to do with scanning. If you have the squelch open, and use push the up or down
button on the mic, it puts the radio into scanmode. Since the squelch is open, the radio stops
right away. If you tune the VFO knob, the receiver seems to disappear until you stop. You will also see the icon in the scanmode at the point. Simply tap the PTT button or go to the scan menu and turn off scan.

Q. Hey, I saw several questions concerning the FT100 not transmitting when used in a rolling
stagecoach over the Oregon trail during a full-moon, but I did not see it here in the
FAQ. What gives?
A. While every attempt is made to keep the FAQ current, it is certainly a work in progress.
The author will try to keep it as current as possible, but sometimes I am using my FT100 too
much to have time to update it.

496. Re: boom mic

Yahoo group: FT100 (1998 — 2000)

From: Michael Jones
Topic: 491 Message: 496

There is an interesting new addition to the HRO Summer 99 catalog. I can all the details if you don't have the catalog. Basically its a mobile boom mic setup complete with PTT and up/down buttons. The mics clip to the sun visor and the PTT, etc is remoted. I can't remember the name of the company offhand, but prices ranged from about 100-150 depending on model and features. I can get all the details if you need them.

Catalogs don't seem to have been mailed out yet, but they should be arriving at your door soon.

73,
Mike

499. Re: Low S-meter readings? (and 1750Hz tone Burst)

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-03 11:33:38 UTC
From: Cliff Bryant
Topic: 483 Message: 499

Per,

I was told by my local dealer that all the radios were returned for a "crystal" change. I've searched the schematics for quite a while now and I can find no obvious crystal that would need to be changed. I mentioned to them that I would expect the 1750/1800Hz to be generated in software (or DSP of course) but they were adamant that it was a crystal. I dunno how technical these people are but at least one is a respected UK amateur of long standing.
Personally I reckon that there must be a link to set the toneburst frequency up. Generating a tone in software is dead easy, it's not as if the tone needs to be accurate to the Hertz as it were.

Certainly my radio generates 1750Hz when you press and hold the [HOME] key.

Anyone got a service manual yet?

Cliff, G4PZK

Hi Mark

Just out of curiousity do you have the separation kit for yours? I'm still waiting for mine to arrive.

Ouch!

Concerning ease of operation - well it's a personal thing I guess.

Enjoy the 706G!

Here's what I come up with after owning the rig two weeks.

1) It would be nice if MEMORY CHANNEL #1 would have a different "beep"
frequency (like the "main" alphanumeric display does has you scroll
through the FUNC key) so you did not have to take eyes off the road while
clicking through memory channels.

2) I have trouble seeing the blue screen in bright light, it gets washed
out easily. I replaced a Kenwood TM-732a dual bander with the FT-100.
The Kenwood had a orange LCD screen and it was easy to see.

Obviously, I'm really digging for something here.

I agree with the folks complaining the the S-Meter seems "stingy." As an
avid QRP op, a lot of my radios don't even have an S-meter so I only care
that I can hear a station. I have at least half a brain so that if the
S-Meter was giving everyone I worked a S9 +20db reading, I'd know enough
NOT to say, "Wow, this rig has a hot receiver!"

I have the FC-20 in my truck with the FT-100.

The unit is about twice the size of the FT-100. It is
very lightweight, and gets it's power directly from
the FT-100 interface cable. It tunes pretty fast, and
overall does a pretty decent job. It fails to tune my
whip antenna on the truck to 17m or 40m (which my
Kenwood TS450SAT would do with no problems).
That's really my only complaint about it.

It has dual 259 connections with an A/B switch on the front
panel. No open feedline connections.

Hope this helps.

From: Jeffkerber@xxx.xxx
Topic: 445 Message: 507

With proper RF grounding the ATAS will tune 440, 2m (antenna cranked all the way down), 6m, 10m, 12m, 15m, 17m, 20m, 30m, and 40m. I get good results on all these bands. However, after letting the radio tune the antenna, I retune manualy (hold PTT and the up or down button on the rig) and generaly get a better a match. I have the FC-20 tunner, but have not used it yet with the FT-100, only my 847. FT-100 is fixed mounted in the truck for about two week and no problems yet.

Got my tuner friday afternoon. Hooked it up and seems to work fine. Clearly it mean for fixed station use. No provisions for moblie mounting, case doesn't look rugged. Came with only a 3 ft control cable.

I tunes much slower than the 850's tuner. Seems to take and eternity, probably only 30 sec, to reach tune. Maybe quicker as it remembers settings. Tuned G5RV on 80-40-20-17. Didn't check higher. Tuned my quad loops, (10&15 meter single elements in parallel with no matching section) on 10-12-15-17 and 20. Wouldn't tune G5RV on 160 but that's to
much to ask. The 850 would just barely. Im sure if I set the G5RV up as a vertical with flat top fed against ground it would tune. That's what I do for 160 meter contest.

From: Joe
Topic: 505 Message: 509

Auto tuners are funny. I'd suggest lengthening
the coaxial cable a few feet and try tuning. My
experience shows that this can change the VSWR at the
radio (tuner) end of things enough to allow the
limited matching range of auto-tuners to match the
whips. May not be a perfect match, but will change
enought to prevent the "keep hunting" syndrom that's
so common.
Best luck in mobile environment has been the little
MFJ tuner that matches their QRP rigs. Actually
handles 150+ watts, tunes six meters (unadvertised,
but mine does it) has lighted cross needle meter, two
power ranges, and is about the same width as the
Yaesu.

Have used one with my Alinco for about 3 years with
good results. Only fault is no "tuner bypass switch,
but I think I'm just gonna modify mine with a DPDT
switch.

As a suggestion, I have heard good reviews of the
LDG-11 auto tuner. Certainly lots less money than
the Yaesu branded product, and you can even build it
yourself and learn a thing or two about how it's made.

Just a thought.
Joe K7JOE

P.S. tried one at HRO in Portland....wow, that DSP is
impressive. Made CW signals that were just readable
through heavy QRN pop out like they were the only sig
on the band. Heard one on the air on SSB and liked
what I heard once the mic and processor were set.

Date: 1999-05-03 18:07:15 UTC
From: k1map@xxxx.xxx
Topic: 510 Message: 510

Wondering if there are any weak signal ops on the list that would be
willing to give a comparison of the FT100's RX sensitivity & image
rejection vs a known decent VHF transciever like the Kenwood
Tr751a/851a, Ts711/811 or MMT 144 & 432 Transverters

Thanks & 73

Hi Cliff

Thanks for reply.

Well, I guess there nothing else to do but to turn it in at my local dealer. I've been trying to avoid it since I would hate to bee without the FT100 for a week or so.

I really enjoy spending time with this new station learning the facilities along QSO'ing on all bands. I'm waiting for the 500 Hz CW filter to show up here in Denmark so I spend time with the DSP which is great.

Regards

Topic: 483 Message: 512

It's a real pain having to take a radio back I know, especially when the modification is probably quite trivial. Hopefully they'll turn it round quickly.

I've been waiting a week to get the separation kit so I can go mobile, maybe this week...

Do you get the DTMF microphone as standard in OZ land? We get the non dtmf mic. It doesn't really matter I suppose but considering the cost it would be useful to have the option.

Cliff, G4PZK

From: tsr172@xxxxxxxxxx.xxx
Topic: 513 Message: 513

Just curious if anyone has any experience using Diamond's MV3A antenna
while mobile with the FT-100.

We dont get the DTMFmicrophone - only the most basics and that goes for all radio's here in Denmark btw.

I'm actually going sort of 'mobile' tomorrow night. First Tuesday in every month we have a 2 M contest from 1700 - 21 UTC. So tomorrow is the first real long burn 'test' of my rdo. Hopes everything goes ok, so far I havent experienced the FT100 going hot even though I have had it turned on for 9 hours with periodically Q's on HF and VHF/UHF. Havent done any 6 M yet.

516. Re: FC-20

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-03 20:49:57 UTC
From: Robert Gauss
Topic: 505 Message: 516

Just thought I would add some comments to this response. I am an RF engineer now working in MRI equipment but years ago I was involved in the design of an antenna tuner for Motorola, for the marine radio service that used the binary switched inductor capactor scheme that is so common now.

--- Joe <k7joe@...> wrote:

> whips.

Change the cable lenght is an appropriate method of allowing the tuner to work. To be technically correct the change in cable lenght shouldn't considered as modifing the VSWR as modifing the impedance that the tuner sees. There are many impedances that have the same VSWR. When plotted on the smith chart they become a 'constant VSWR circle' around the center. Some of these points may be within the match range of the tuner and some may not. Changing the cable length moves you around the circle and may get you within the range of the tuner. A tuner that is specified as being able to match a 3:1 vswr should be able to match all points within that circle. It is likely that it can match many but not all points outside that circle.

This is just a question of value. I looked at it recently and decided that the assembled cost of $220 was not a bargin over the FC-20 at $270. The radio compatablility, the higher resale value and Yeasu service were factors in setting the FC-20 value in my opinion. I was able to purchase an unused FC-20 for $225 from someone who got it as a promo with his FT-847. No contest in that decision. The LDG AT-11 can be purchased as a kit for less. You have to set your own values as to your time winding toroids. I do not know the tune matching range of the AT-11 vs the FC-20. It may be larger (or faster) and those could be a factor. I earlier posted my experience that the FC-20 was slower and appeared to be not as wide matching range as the internal tuner in my (former) TS-850.

OK on the basic radio. We don't get DTMF or CTCSS in G. The CTCSS is available as an extra. The TX CTCSS is included (built in!) it's the decoder you pay for. I'm not sure if I'll bother. OK on the mini contest, I'd be interested to know how that works out.

Maybe we can try a sked sometime FT-100 to FT-100 either mobile or more likely on main station antenna.

I hope my ATAS and separation kit arrive tomorrow. I'll be itching to get home from the salt mine!

Yes... the "mast" section of the Hustler system is a 1/4 wave 6M antenna
by design.

Does it work WHILE the loading coils are on it?

From: John
Topic: 521 Message: 521

It looks like the CAT system can not store (Upload) the contents of the memories. It would be nice if I could program all 300+ channels by the serial port.
Maybe their is a clone command thats not in the manual...

Hello Everyboby Again...

After returning two FT-100s with problems I picked a IC-706G. This radio got execellent reports on and off the air, not like the 100.
The very first thing said to me on air was "WOW"
now thats how a radio should sound!! The FT100
had a "muggie" sound to the audio unlike the IC706G. Even my wife who isn't into radio made a comment on the 100s poor sounding receive audio
sounding "muggie"! Other than that the IC706G
seems to work 100% and i'm VERY happy with it!
Too bad I didn't go with the Icom first, would have saved me a-lot of trouble. Don't get me wrong, I still like the FT100, but after having
two go-up in smoke and really poor audio, ETC...
I had to do something. Doesn't feel to good when you spend 1700 dollars on a loaded 100, to have to send it back to Yaesu for a month so they can
re-work all the bugs out. Thats bull---- as far
as i'm concerned!! Oh-well life go's on at your and my expense. Oh ya, I do have one complaint
agains't the 706G, Does he NB really work? don't seem like it!! Also the DSP works as-good as 100,
just not as many buttons to play with!

73s... Rob

Hi Rob,

Glad to hear you are happy with the Icom. Good luck. Sorry to hear you had problems with the FT-100. But if you found something that works better
for you GREAT!! Wouldn't it be a real boring world if we all liked the same radios? (Hi, Hi).

Now if hf would stop being so dead......

Topic: 528 Message: 528

Someone was asking about mobile microphones a while back.

I have taken the mic to bits and traced some of the circuit. The audio is no real problem.
Basically the +9V supply is dropped via a 2k2 to a zener with a 4u7 tantalum across it and the zener voltage is used to bias the electret via a 1k8 and a 1k in series. The 1k has a .1u across it to feed audio out. The electret is decoupled with a 100p or 1n or similar as is the junction of the 1k8 and the 1k. The output is taken via a .33u also from the junction of the 1k8 and the 1k.

So far the easy bit... The PTT and control switches must operate in the analogue domain i.e. different resistors are pulled to ground via diodes (I think) to determine which of the 7 switches have been pressed (non DTMF mic). All pretty complex (relatively). I propose to do what I did to the Standard C5900 in the xyl's car - add the electret and PTT in parallel with the mic, disconnecting the internal mic either via a switched jack socket or permanently while the radio is in the car.

Either the above or I'll have to build quite a complex mic circuit to enable the radio to be controlled. I need the up/down buttons to trim the ATAS-100 and the PTT of course!

The other way is to use the fist mic of course. That's technically illegal in the UK these days, although the principle is not yet enshrined in law.

Curiously the microphone has got a heavy lump of metal in it, presumably just to provide mass.

Cliff

529. Mic circuit

Yahoo group: FT100 (1998 — 2000)

Topic: 529 Message: 529

Some more mic information:

The PTT puts a 27k to ground on SW1.
The up button puts 27k in series with 39k to ground on SW1.
The down button puts 27k in series with 39k in series with 82k to ground via SW1.
The ACC button puts 27k in series with 39k in series with 82k in series with 220k to ground via SW1 (Phew).

As I'm not really fussed about the lock button and other P1/P2 keys I'll probably reach for the veroboard and craft me a mobile interface in a box.

Cliff

Hi all,

Just thought that you might like to hear about a positive experience with a new radio.

I have been looking at what to do about getting a HF mobile set up in my new (last year) 5th wheel hauler, a 1998 Dodge 2500. I have a Kenwood TM-732 (that will soon be hitting the road for sale) and an Alinco DX-70. I had been using both in a previous install with pretty good results. I had (and still have) to leave the HF radio intact and not separate the head from the body of the radio. Same thing with the Kenwood. There is not a log of room in the Dodge. I know, with a truck that big you would think that there would be room, but with the third seat in the middle of the front and the enormous cup holder (I like my coffee!) there was just not room. There is another ham here locally that has a Dodge and just got the new FT-100. He has mounted the radio on one of those flexible mounting stalks like you would mount a cell phone on. It works really nice! Anyway, picked up the FT-100 and the ATAS-100 auto tune (Yaesu screwdriver) antenna. I cannot say enough good about this setup. I have purchased and built a lot of radios over the years, and have been more pleased and had more fun with this radio and antenna than any other commercial setup, it is cool!

The radio is really compact and light. I have the complete rig mounted to an adjustable cell phone stalk mount right at the edge of the front seat and bolted to the floor. This allows me to move the radio out of the way if needed, but it is right at the edge of the fold down center "table" for finger tip operation. This console also it perfect for CW work mobile. I have the antenna mounted on the edge of the hood using a Diamond fold down UHF/VHF antenna mount. The ATAS-100 accepts a standard SO-239 mount. The antenna gets its DC voltage to spin the motor and tune the antenna via the coax so there is just one connection to the antenna base.

I have made several contacts with the setup on 17 SSB, 20 CW qrp, 40 SDB, 40 CW, and 20 SSB and so far all of the reports are great. This is a really good CW rig. I don't have the crystal CW filter yet (comes in 500 and 300, I am getting the 300) but it does have a killer DSP setup built in. You can adjust the noise reduction, the amount of notch, and the CW bandpass. It comes with 240, 120, and 60 hz bandpass choices for the onboard DSP. With this kicked in, there is some reduction in audio output but makes the difference between hearing them and not. This DSP works! And a word about the noise blanker. I have had trouble with 20 meters mobile as I have a fair amount of ignition hash. The DX 70 would not dent this. The TS140 that I have would get rid of just enough to make it workable. The FT100 kills it all. With the NB off, I have S7

noise. With it on, it all but disappears. Killer!

Everything on this radio is adjustable via the menu. Power out (to nothing) on all bands and modes from 440 to 160 meters, CW keyer mode (straight, iambic a and b, bug!) and speed, cw memory, FM deviation, SSB compression, modulation level, on and on. It is easy to use and the choices are staggering.

To tune the antenna, all you do is push the tune button on one of the menus and it adjusts. The manual says that it is not optimized for 30, 17 or 12 meters, but I have had great results on 17 and 30 meters so far.

I am pleased. Sorry that I rambled, but thought you all would like to have first impressions. I have had the rig for about a week now and would recommend it in a heartbeat for anyone that is looking for a killer all band all mode mobile or base. I will let you know about the vhf and greater performance as I get more time on those bands.

532. Mic Gain setting - HF SSB

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-04 22:48:38 UTC
From: Walsh, Tom
Topic: 532 Message: 532

K7JOE was patient enough to work with me to get the correct
mic gain setting... He had an IF spectrum analyzer and ear,
and we concluded that about "43" was correct. Note that the
default was "50". Naturally, this could vary by operator.
We were about 5 or 10 miles apart, don't know if that would
make any difference. Thought you might like to know.

I've used it to tune in PDX and the hillsboro approach control freqs. I noted
that the planes seemed to sound lower volume than the tower operators. Other
than that, it seemed to be a hotter rx than my Realistic pro-2006, which is a
big change from other wide RX ham rigs.

Dear FT-100 owners,
Could anyone give me a report on the AM reception of the FT-100
on the air band?

What's "Grow to Give"?
http://www.onelist.com
It's a new incentive program at ONElist. See homepage for details.

We are all a part of this Lets make it as good as possible.

Cliff, I have been running a electret desk mic here, home brew,element is radio shack, and power for mic is from 9v in base. But been using vox only, couldnt figure out the switching for PTT. I also am running a electret head set the same way, with vox. Was thinking of putting a 3.5m jack on the mic just to plug in a head set and use the mic (original) for all the other functions. But theres got to be a better way. Thanks for keeping us posted. If you figure out the switching for ptt please share it with us. 73s Mike, KF8MY

All, I am curious -- how can a screwdriver antenna
(continuously variable tapped coil) not be "optimized"
for 17 or 12 or 30M? Theory says, if it can cover 40
and 20, then it should be able to tune up to (or down
to) 30 M.

Just curious.

Joe, I am currently using the ATAS100 with my FT847. I have "NO" problems
using and tuning the ATAS100 on any freq between 7.000Mhz and 54.000 Mhz.
I am seriously thinking about buying the FT100 for the mobile. That 847 is
a little LARGE, hi hi, but the 847 is a great base station rig. 73s

I read this note on the list and leaves me wondering.

Does it say in the manual what is not optimized?

Does it have a schematic of any sort?

Short mobile antennas generally require both a 'tune' and a 'match'
element. The tune is most critical and is the variable inductor in
your antenna and the fixed inductor, adjustable tip rod in Hustler
style antennas. After tuning to resonance most short antennas are less
that 50 ohms real, and require something to match them up. On a single
band base loaded antenn this is often a shunt capacitor or a tap on the
inductor. Moving the loading coil up the antenna raises the radiation
resistance (and efficiency) but makes the inductance required larger.
Larger inductance also mean larger resistive losses in the coil. I
believe Hustlers are near to 50 ohms because of these two factors.

I wonder if the Atlas antenna has any shunt elements in it they may be
selected as the slider moves on the coil? Don't know. May be it does
but not included for the 30 / 17 meter bands.

Comments?

Joe:
Yes, in principal you are correct, aside from the feed point impedance issue, that it should tune across the entire frequency range. That is however excluding any external influence. In a practical installation, other nearby objects, and the vehicle it'self, affect the antenna and can in fact cause the antenna to not tune at certain frequencies. Start by making sure that the ground at your antenna is a good ground to the vehicle and as much as possible bond all vehicle body parts together for RF. Keep in mind that (remakably) many current vehicles have body parts that are not electrically connected to anything and that may also be true of where the antenna is mounted.

Terry-
If you can only have one...
FT100 full breakin CW is very nice, if you are interested in CW.
FT100 can go mobile. FT847 is a bit much mobile. Is mobile an
issue?

If mobile or CW is hot issue for you, I recommend FT100.
If not, I'd recommend the FT847.

I'd pick the FT100 if I had to pick one (have used both, in both fixed
and mobile, phone and CW).

From: Cliff Bryant
Topic: 545 Message: 545

A minor correction to an earlier post. The ATAS-100 trim controls up/down are the up/down buttons on the rig control panel, not the up/down microphone buttons. Hence a simple PTT can be made by connection SW1 to ground via a 27k. I'll prove this in a few days.

Cliff

Bob, I don't beleive this ant is short. I make and sell screw driver antennas for 10-160.
And true you do need matching for the lower bands(40m -160). I dont think this antenna
would need any. Why I say that is,it would only need it on 40m, that is if it was effeicent enough, that is if the Q of the coil was high enough. From just looking at it, I don't think its to effeicent there so impedence is near 50ohms. These antennas are working at 1/4 wave, so it is possible to get enough coil out to make it to forty meters. As this antenna goes up in freq. it will use less coil to resonate, and still be a 1/4 wave, becoming more effeicent. On 2m this antenna only needs to be 19" long! You should also see a resonat point on they antennas at 3/4 wave of the freq. and they may be doing that also. I don't know if automatic tuning of they antennas will let that happen, but you should see low swr there also. So probably the only place this antenna is really SHORT is on the lower freq. and is not very effeicent, BUT that doesn't mean you are not going to make dozens of great contacts.
I use a 3" diameter screwdriver ant on my car(it works 160m thru 6)with the FT-100 and can resonate this ant at 3/4wave on 6m with 1.1 swr and get great reports. This ant is resonating at 7.225 but falls in on 6m.
If any one has a regular screwdriver,try this. You will need no matching, so if you are using matching take it out, if your using a 2" screwdriver it will be between 40 and 80m. The dip or resonat point will be very sharp so watch closely!! Have fun, love my FT-100.

You and I are actually saying the same thing. The antenna overall length is short, much less than a 1/4 wave (especially 40, 30, 20) The loading coil makes it an electrical 1/4 wave but the radiation resistance is low. Coil losses and ground losses all add up to raise the load impedance and can get near 50 ohms as you noted and is practice with most mobile whips.

An interesting consequence of this in antenna design, as you have hinted, is the the bigger (diameter & wire gauge) and higher Q of the loading coil the lower the loss resistance, and more likely the need for some matching. Lossy coils like the fiberglass ham sticks can be very good 50 ohm loads and quite broadband because the loss of the coil adds to the low radiation resistance to come closer to 50 ohms and lowers the Q (raises the bandwidth) The obvious downside is they are not as efficent radiators, that is the transmit power goes to heating the lossy coil.

This is wandering from the FT-100 issues a bit. No one has explained why the statement 'not optimized for operation on 30, 17, 12 meters' was made. I do not have at ATLAS antenna. Can someone confirm that statement was made in the describtion of the antenna?

I don't know if they are running 3/4 wave resonance on some of the VHF bands. I know local hams who are running 2 meter 1/4 wave antennas on 440 as 3/4 wave. This is bad practice (at least in theory) because 3/4 wave vertical antennas have a null in their pattern at the horizon. The power is being radiated up at some angle. Because the car isn't a perfect ground plan and many other things enter into the path between transmitter and receiver the practial difference may be small.

I think your last statement is the most correct "Have fun" Hams have a long and proud tradition of ignoring theory and making things work.

Mike,
When I saw your mention of manufacturing HF screwdriver antennas I thought you might be someone I could ask a couple questions of.

I have been the proud owner and user of an FT-100 for about three weeks now. First got into the hobby when I was 14 - had a brief 25 year hiatus - came back to the hobby about six years ago. I've wanted to go HF mobile since I was 14 and now, the past three weeks, have enjoyed it more than I could ever begin to explain. Have worked many states (mostly on 40) and probably over a dozen countries (15 & 17) with rewarding signal and audio reports from the car. Seem to be spending more time in the car than I ever have !
My question mainly concerns if you might know how the ATAS-100 antenna functions on 2 meters and 440. I presently have a dual band 2m/440 gain antenna mounted on the front edge of the trunk and had hoped to be able to remove that after installing the Yaesu screwdriver. No such luck! I have no complaints at all with the antenna on 6 through 40, but on 2 meters, its performance is well below that of just a 1/4 wave on the trunk. Any suggestions on a modification/add-on which might help the performance of the ATAS-100 on 2 meters ? The screwdriver is mounted on a '99 Mazda Miata. I had a receiver-type hitch welded to the frame of the car and had a riser made up which plugs into the hitch and then comes up about 15" so that the base of the antenna is pretty much even with the top of the trunk. The Miata's battery is in the right-rear fender well and the cradle for the radio body is bolted to a frame rail in the trunk, about a foot away from the battery. A short (4-5') piece of LMR-400 connects the radio to the base of the ATAS-100.

As an 'aside,' I operated the FT-100 as a portable station from an Indianapolis hotel last weekend. Used the ATAS-100 with the add-on 4-radial kit from Yaesu (think it's the ATBK-100) and it really worked great. It was really neat working a couple of Special Events from the hotel room. Clamped the antenna to a railing on the balcony and used one of the LDG, AT-11 tuners, with a single 65' counterpoise radial attached to the back of the tuner and laid around the base of the walls in the room. Great fun and I plan to do a lot more of this.
Besides the 2m/ATAS-100 question, wonder if you might be able to send along some info on the HF screwdriver which you manufacture. I like the Yaesu screwdriver a lot, but would like to be able to operator 80m mobile.
Thanks,
Ron, K9ZE

Yesterday I noticed the SWR X warning icon pop up on my FT-100.

I don't use 440 very much, but I had had a couple QSOs up there on a local repeater. Anyways, I was using a dual band mag mount so I thought perhaps the antenna had gone bad. So this morning I put a different antenna and mag mount on the rig. When I tried to "kurchunk" the local UHF repeater, the SWR alert popped up again.

Oh Oh.

So I put a 50 ohm dummy load. Guess what?

Oh Oh.

Reset the CPU...

Oh Oh.

Now, from what I understand, the 2M power module is the same one that gets used on UHF. 2M TX is fine.

Ideas? It's not going anywhere until after Dayton, that's for sure.

First thing to do Paul is to put a SWR / Power meter in line with the dummy load and see what kind of power you are getting out. If the power out and swr is within range then the problem is probably with the metering circuitry in the FT100.

Yeah... actually, that is the second thing I'll do. But, I am 99%
certain that the RF output is WAY down. I could not get into the repeater
I am talking about and it is only about three miles away. I can key it
with an HT.

Paul:
When the VHF/UHF output went south on my radio, the SWR was still
indicating according to the load. I'm wondering if you have a problem with
the VHF/UHF cable on the radio. If for example the crimp on SO-239 had
failed, the radio would see high SWR, but any meter you connect to the
output would show low output power but good SWR. This would also be true
for a failure with the way that cable is connected inside the radio.

Bob, I don't beleive this ant is short. I make and sell screw driver
antennas for 10-160.
And true you do need matching for the lower bands(40m -160). I dont
think this antenna
would need any. Why I say that is,it would only need it on 40m, that is
if it was effeicent enough, that is if the Q of the coil was high
enough. From just looking at it, I don't think its to effeicent there so
impedence is near 50ohms. These antennas are working at 1/4 wave, so it
is possible to get enough coil out to make it to forty meters. As this
antenna goes up in freq. it will use less coil to resonate, and still be
a 1/4 wave, becoming more effeicent. On 2m this antenna only needs to be
19" long! You should also see a resonat point on they antennas at 3/4
wave of the freq. and they may be doing that also. I don't know if
automatic tuning of they antennas will let that happen, but you should
see low swr there also. So probably the only place this antenna is
really SHORT is on the lower freq. and is not very effeicent, BUT that
doesn't mean you are not going to make dozens of great contacts.
I use a 3" diameter screwdriver ant on my car(it works 160m thru 6)with
the FT-100 and can resonate this ant at 3/4wave on 6m with 1.1 swr and
get great reports. This ant is resonating at 7.225 but falls in on 6m.
If any one has a regular screwdriver,try this. You will need no
matching, so if you are using matching take it out, if your using a 2"
screwdriver it will be between 40 and 80m. The dip or resonat point will
be very sharp so watch closely!! Have fun, love my FT-100.

555. ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-06 23:32:42 UTC
From: Cliff Bryant
Topic: 555 Message: 555

For anyone interested I fitted my ATAS-100 to the car and after properly earthing the antenna, it tunes 40m to 6m no sweat. I did have an rf problem at some points when rf was obviously getting back into the system. Some investigation showed this to be via the extension speaker connector. I had an existing installation in the car using two core bell wire to connect to the speaker. I added a ferrite to the speaker cable and the problem went away completely. I suppose I should rewire the car with the Yaesu speaker extension wire but it's much too long and far too much hassle.

The moral has got to be "Watch out for proper earthing and RF engineering". I relearn this lesson everytime I install a radio in the car.

The radio is working fine at the moment with the slight problems of some people reporting me to be a kilohertz off frequency on 2m FM (SSB is ok) and as reported by other stations I'd say the S meter is quite mean, signals that were 60 over on the 706 are now 20 over at best. The 706 wasn't calibrated so who knows which one is correct?

Only the 70cm bypass circuit (there is a 160W Mirage in the car) and the boom mic and ptt to be added now.

There are several available these days Donald, most (that I know of) are custom made. HRO just started carrying a model by T.J. Antenna Co. (see Summer 1999 catalog pg. 90). Also, the High Sierra brand is popular here in California. See there website at hsantennas.com or check QST Magazine for their ads. You'll tell him about the others ya'here! Gary, KF6LRV.

Dear Cliff,

I believe I ran into this same problem. I believe your problem is that your radio is starving for current. As a result you are off freq. In my original install for this radio I had 17+ feet of 12 gauge wire running from battery to radio. When working mobil with the engine off I got off freq reports left and right. If I started engine or brought the radio indoors to the 30A power supply everyone said I was dead on freq wise and a freq counter backed up the above 100%. I measured voltage at rig and observed that with rf-tx power at 100% and car engine turned off voltage dropped to 11.2 vdc....

I doubled up the two 12 gauge wires for Positive and found a good ground point in the passenger compartment for ground. Now am able to leave engine off and have enough current to say on freq when transmitting. I suspect you have same issue. Measure your voltage at radio when transmitting. Should not drop below 11.5 vdc at the worst case.

Allen

Hi Allen

Thanks for this information. I find it rather strange that low voltage should affect the frequency so directly, surely the relevant circuits are regulated? However I will check the voltage off load. I do have the old IC706 cable installed for the +ve supply, the negative is bonded to the vehicle chassis. The frequency problem occurred while I was mobile, driving along so the voltage should have been high enough. I've never had a problems operating with the engine switched off but I'll look into it. Thinking about it the rig was only generating 25W because I have a 2m linear that produces 160W for 25W in so the current consumption should have been quite low. I'll investigate further....

First day mobile with the ATAS-100 is about to start.

Hi Cliff

As promised here is a little opdate on my first real 'long burn' test of my FT100. I went mobile for competing in the NAC 145 MHz contest. Just a little setup with a 9 el Yagi and the 50 W (aprox) from the FT100 connected to my Car batteri.

I operated for 4 hours SSB/CW. Here's my observations:

1) The rig didnt get abnormal hot during the test. Nothing in the near of 'not touchable'.
2) It handled the 'Big Guns' great (ofcourse not as my FT1000MP) even though I dont have any optional filters on AM/CW. The DSP works ufb for me.
3) It was very stable eventhough just connected to my car battery (40 aH) and without the engine running. Still power enough to start my car afterwards and go home.
4) I got great reports on the modulation (without asking first for a report).
5) The rig is 'quiet' in RX but the sensitivity seems to be fb and combined with the DSP I experienced 'digging' out stn that I otherwise coulden't hear.
6) The internal Keyer was OK (I used the memory a lot) but the settings for the speed is not smart and not accurate (eg. speed 30 in setting isn't speed 30 in real).

So it was a very pleased Ham driving home that night with a fully functional FT100 (eventhougt I was prepared for malfunctions with all I've read in the List). This is a great rig for me as the portable rig for vacations, small fielddays etc.

Still, this is not at all any scientific review just my experiences from a average user.

Well, I hate to admit it infront of all the Icom lurkers, but my FT-100 has died yet again. Exact same symptoms as death #1. ATAS tunes to a proper match but finishes with the high swr icon. No Rx audio on SSB. Rx audio exists on FM but no S-meter reading. Max power output on all bands all modes is about 2 watts.

Off to Yaesu...yet again.

73,
Mike

Hi Mike

The ATAS is excellent! I've had quite a few QSOs on all bands 40 to 6. I worked all over Europe today and received 59 reports. I was initially worried about the bulk of the ATAS but it's fine. All I can say is looking at the size I'm amazed with the results, I'd really like to see the innards of one of them. The shop people wanted my feedback on the ATAS as well.

Basically HF mobile is now possible with a minimum of fuss, the only worry is that someone might steal the ATAS off of the car which means I take it off the car when I'm not around.

I haven't tried the antenna on 2m or 70cm as it's rated for 120W SSB only. I've run 100W on 6m FM with no trouble.

Pity it can't do 80m of course!

All in all very pleased even though they are 250 UKP (about $360 US I guess).

Anyone want to buy a collection of whip antennas bought over the years?

Hi Per

Great to hear that your mobile operation was a success. I agree with your conclusions. Someone was saying that they took the FT-100 and an ATAS with ground plane on business trips, what a great way to pass the evening in an otherwise dull hotel bedroom.

Don't you have 'lemon' laws in the US? After three failures I think you are very patient.

Here in California, the lemon law only takes effect after the 3rd fix for the same problem. So, since this is number three I have to let them try to fix it again.

OK, that's very interesting Mike, we don't have lemon laws in the UK. Sometimes it can be very difficult to get something changed. Good luck, let's hope this one does it for you.

Here's a repost of what was repaired the first time, the second was essentially the same.

Received my FT-100 back from Yaesu today. It still looks as nice as when I first opened the box. Here's the info on the invoice of what specifically was done to it.

2 chip cap, GRM39B104K16PT $0.09 each
2 chip res, RMC1/16 823JATP $0.03 each
1 chip res, RMC1/16 683JATP $0.02 each
1 chip res, RMC1/16 473JATP $0.02 each
Replaced PA Unit $ no price given
Complete burnin test and aligned to factory specs.

Labor $75
Parts $0.28
Freight $10.06
Credit $-85.34

Total $0.00 Warranty Repair

Unfortunately they didn't list a price for the PA unit, would have been interesting to see what the part cost on it would have been. Anyone know?

73,
Mike

Good evening group. I signed into this FT100 site a few days ago. Great insights to review before I make the investment. Question, "only respond if you also noticed that it is broken", I cannot get into the Ayes Home page from this link or through a dealers link??? Maybe Yaesu is upset about the few Ft100 OhOhs???

Hi paul.

I had the same problems when I went through two FT-100s just before they
smoked!
Sorry you'r having this kind of problems with what I thought was an
excellent radio until
mine smoked! As far as i'm concerned there are way to many radios being sent
back
for repairs. I just got fed-up and bought the IC-706IIG and have had great
sucess since.
Just hope you don'y go through two like I did! :)

Hey this is the FT-100 list Rob :-) (Only kidding!)

Serious comment: I bought the FT-100 because of the ATAS-100 support built in. I've been hearing about 'screw driver' antennas ever since. I've not come across them in Europe before. I assume that they work on a similar principle.

Dale,

If it is not too much trouble, I would love to have a copy also. The first thing that I noticed about the FT-100 manual is that this was excluded. Not very good thinking on Yaesu's part.

Thank you very much,

Tom, W7YW

How many radios have to fail, how many people have to return units, how many people have to buy a radio so it can be promptly sent off to Yaesu before people get the idea that this radio is just *way* to premature. It looked real good on paper...

Go buy the ICOM. I'll wait till the FT100-B comes out...

My FT-100 worked as spec'ed right out of the box and is still truckin'.
There are always a couple of lemons, but let us not condemn the
entire lot.

Hi paul.

I had the same problems when I went through two FT-100s just before they
smoked!
Sorry you'r having this kind of problems with what I thought was an
excellent radio until
mine smoked! As far as i'm concerned there are way to many radios being sent
back
for repairs. I just got fed-up and bought the IC-706IIG and have had great
sucess since.
Just hope you don'y go through two like I did! :)

Hello Cliff!

Friday May 07 1999 20:33, Cliff Bryant wrote to 'FT100@onelist.com':

CB> Basically HF mobile is now possible with a minimum of fuss, the only
CB> worry is that someone might steal the ATAS off of the car which means
CB> I take it off the car when I'm not around.

I've been surfing the net to have a look at these, and pictures of them, other than from far away, or just of the expanding portion, seem hard to find. From looking at it, would you say that it would be possible to mount it on one of those trunk edge brackets that allow the antenaa to be flipped into the trunk (boot for those in the UK) when parked in a place with undesireables.

How difficult is it to remove from the mount you have now?

Lastly, do you have the ATBK 100 base kit? What does this thing look like, and hope is it mounted?

Hi William

First of all I have a Subaru Forester so it doesn't even have a boot! However the antenna is mounted via a simple PL259 screw thread like all the other standard antennas. I have two heavy duty hatch back mounts (liftback in the US?) They are diecast and have a much larger surface area covering the car's metalwork. To remove the antenna you simply unscrew it - a 10 second job. I wouldn't want to leave it at some of the rallies (hamfests) I go to during the summer I'm afraid.

I don't know the flip mounts you are referring to but I would guess that any mount suitable for holding the ATAS in position at 100mph (we drive FAST over here - only kidding) would not really be able to flip. It's a good point though. Actually in the ATAS manual it does say that you shouldn't use a mag mount to hold the antenna - also it's essential to get a good rf grounding as I said before.

Tell you what, I've been reading about a common directory that we can use to drop files. I tried to access it but couldn't but in any case if anyone is interested I'll put some JPEGS of the installation on the web somewhere, either here if I can or on another site I have if needs be.

If anybody else has any photos of their installation that might be of interest or prove useful maybe they can do the same or send them to me and I'll generate an ATAS page on my family web site.

Topic: 599 Message: 599

Well, I've had the FT-100 for 5 weeks now. I've used it every day, every band, and every mode (except packet)
I have had no problems with it, and it does everything the specs say. I think the June QST article tells it very well.
The only change I made was to increase the side tone level on cw with vr04 under the cover and add the am filter.
I have used many commercial mobile rigs through the years, all the way back to when I had to build my own.
Without a doubt, it is the most feature rich, dependable, enjoyable mobile rig I have every owned.
A friend of mine was over here yesterday and spent three hours "wringing it out" and he was so impressed he plans on buying one at the Dayton Hamfest next week.
I recommend it highly to anyone that wants an excellent mobile radio.

Duke

Pres Waterman,
It is wonderful that you are able to express yourself not only through different media outlets, but that we share freedom of speech, but I think the time has come for you to can the comments. I am very aware that you had several problems with your Ft-100, and that you are a recent convert to Icom, instead, of the Yaesu. I am sorry that you were so upset at the failures of the Ft-100, I am sure I too would be upset, but I use what God gave me and make my decisions based on my knowledge as well as my gut feelings on purchases.
Basically go slam Yaesu else ware and let the rest of us use this media to enjoy what we enjoy, our radios, and our choices. I would hate to have to slam Kia cars that you are so proud of I own one and sorry I do but except the problems that I have allowed myself to purchase, and don't spend every moment on how the Kia dealers are crooks or that they lie nor that the service stinks, and all from a company that has since filed for Bankruptcy since my purchase was my decision, so in my opinion can the crap and type elsewhere. Take this in the light of being a human, and take the stupidity of being human down the road...

Hi John

Good point about a longer whip section. I might try that.

Just building a boom mic interface. Why couldn't they put the bias circuitry in the rig so I could couple an eletret directly? Ah well, reaches for the soldering iron and pillar drill....

Hi John,

I have a full size Chev. van and I am very interested in your mount. Could you possibly tell me more about it or possibly you have a picture. I have been staring at the ladder for some time now, trying to figure out a way to mount the ATAS.

Thanks a million for your help.

Hi everyone,
Been reading the mail for several months now. Just got my FT-100 last
week.
Doing Fine so far.
Does any know what type of Power Connector is used. I would like to get
one or two
for other cars installations?
I called AES and HRO but they don't have any info. Was hoping maybe I
could order
one from Allied or Newark if I had the Mfg and Type.

Hi,

Can anyone who has mounted the ATAS tell if it is o.k. for the base or coil of the antenna to be beside the chassis (body) of the automobile or is it necessary for the base to be clear or above the body. I have a full size Chevrolet van and it will be very difficult to get the base above the van. If anyone can help me out, I would really appreciate it.

Thanks,

Actually I quite agree with you about the bickering. I am interested to hear how people are getting on rather than comments about the design team, especially since the team isn't in Europe anyway.

Anyone built a mobile mic setup yet? Any RF problems getting into the audio?

Tom

I've got my ATAS base about 6 inches from the top of my Subaru. Obviously the if it's above the vehicle in free space with a good ground plane that is best, but my setup seems to work.

I do have the antenna as far away from me (the driver) as I can. 100W is quite a lot of near field.

Accepted. It is often difficult to tell who said what in a quote, and a response. Proper netiquette suggests trimming relevant parts for reference and replying. But that can easily seem as the original quote was falsely attributed to the replyer. I was simply using a phrase I heard one of my salespeople using when after an hour of being beaten to within a few dollars of his Livelihood, he simply couldn't take the frustration and told the prospect to "take it elsewhere". It happens.

I would hope that my strange wit would NOT get me invited off the list. Just today in the service department a customer asked me in a very basic way if installing a "1500 watt communications radio" would disturb his Kia's computer. He was tickled when I told him how successful I was on 15m from my Sportage. I suppose it would be wierd to imagine a dealer knowing about radios and cars. Point being, I would like to offer some expertise to the list as regarding mobile radios and the fancy mounts used.

However, I am guilty of trying to express frustration in the past that we have a bunch of buggy radios. I was annoyed that we were accepting it as early production problems, expected in a radio such as this. As others have pointed out, they have had almost a year to work it out.

From: John Woika
Topic: 612 Message: 612

Hi group, well I have two vehicles, a 97 Olds Cutlass and a 95 Ford E150 full size van. I have been mobile operations since the late 60s.

On my last experience with the Outbacker Perth, their instructions ask that you not mount the unit directly against the metal tailgate or back door. Too much inductive coupling???? So on my van there is a ladder on the back door which is about 5 to 6 inches from the metal door. I bring ground to the connector with a piece of tinned RG8 braiding. This has sufficed for Hustler antennas, The Outbacker and now the ATAS100. I think the bottom foot of the ATAS is the motor drive and other devices in the metal sleeve. It looks like the radiation of the antenna may start at the bottom of the accordion boot.

I will try to load jpeg's on here tomorrow. Pix are worth 10,000 words in any language.

Lamar-
Two approaches possible. Await the accessory power cord that will command a price of between 25 and 40 dollars US; or 'snip' the cord you have and insert
proper current capacity quick disconnect connectors. Install the mating connectors
in each vehicle. Move the pigtail with the radio. That's how I do it. There is
a local vendor of anderson connectors, and these work quite well. I also use them
in the shack on each radio and power supply.

Others have mentioned 4pin Cinch as a viable connector for this use. That was
the version I used for the first ten years of hamming. I'm much happier with the
anderson solution. The cinch is hard to solder 10 or 12 gauge stranded wire to,
and the potential for shorting after assembly is fairly high.

Good luck, whichever approach you use.

Guys-
I haven't heard much from others who have done this, so I'll chime in...
I have the ATAS mounted with magnets (5 each 5 inch). It is quite happy
at 100Mph (we actually do drive that fast here, but not faster since the
fuel computer shuts things down if you hit 100 in third - 454cid 95 GMC)

I would recommend that the van owner consider this, since there is lots
of area on the roof to accomodate the magnets, and the base of the antenna
is at least partially radiating.

I have had no tuning or other difficulties since installing a single short
ground strap at the rig. Nothing other than capacitive coupling at the
antenna.

Those magnets must be mighty strong (I suppose they are) I'd still recommend a mechanical solution with proper earth bonding at the base of the antenna.

If it works, it's legal.

(We also drive at 100mph, actually just below - 100mph = automatic driving ban!)

Please send a picture of the vehicle with magnets on Tom, they won't believe me at the local ham shop.

For what its worth, I had all Icom,kenwood and Yaesu power plugs in my shack and vehicles. What I did was use the radio shack heavy duty 2 conductor connector#274-154 and cut the new Yeasu cord about a foot back from the radio and all the others that I have. So ar so good, its rated at 20 amps and seems to be working fine. Now I can go from Yeasu, or I can put the Kenwood on, or the Icom. Works nice when changing Rigs. Have fun 73s, Mike-KF8MY

There is a movement in a local club here to adopt that easy to find and
use, Radio Shack 20A plug as a defacto standard for all our gear.

We are making them so that the positive lead is in the triangle-shaped
side and ground is the flat square side.

>direct, also am using remote head kit with that radio, and planning on
>putting the Ft100 in car also. By the way it is a 96 Kia Sephia,

I don't believe the remote head is an issue. Nor do I think ferrites will help alternator whine. My experience with whine has been that a choke inline with the plus lead is effective.. It will take a helluva big 'un for the current required by the FT100.

Say, you mentioned the Air on. Would it be the buzz from the blower, rather than teh alternator? Alternator whine varies with the engine RPM.

These thoughts are musings of a ham who owns 300+ cars, not an official dealer or manufacturer position.

Pres:
Yes, they've been working on the design and type acceptance for the radio for some time. However, as I said a while ago, some problems don't show up in prototyping and pre-production testing. The reasons are often related to errors in assembling the radios on the production line and sometimes component changes due to availability or price. The radios may actually have tested very well prior to production.
A couple examples would be that there have been reports of the fans not blowing the same direction or blowing in a different direction than another radio. This could indicate an error by someone assembling some of the units. On mine, when the VHF/UHF final went out, I found some comments from the supplier that they have had other people selling some parts with their proprietary markings. While they didn't list the actual part the FT-100 uses, they were similar. There's a possiblity that Yaesu's been the victim of some such shenanigans.
I think you can see where I'm going with this. Not only have there been reports of some radios failing, even multiple times, but there have also been reports of some radios working very well under heavy use. That's why I'm inclined to stay the route with Yaesu on this one. Also, I really don't like the IC706MKII I have, for a variety of reasons, and I really liked the way the FT-100 worked (still waiting for it to come back).

Paul:
Before you adopt that connector as a standard, take a few and see how easy it is to get at least one connection and sometimes 2 when you try to plug them in backwards. It could just be that I was drinking more back in those days, but I used to use those a while ago, and have since gone to ones that absolutely can't be connected backwards. If you still want to use something easily availble at Radio Shack, consider using some of the 4 conductor connectors they have that are harder to plug in backwards.

623. Re: secure ATAS mount

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-09 03:47:23 UTC
From: Bruno
Topic: 623 Message: 623

I have a pair of the Comet(NCG) CQ5m mounts on my car. One for
a multiband VHF antenna and one for HF. Using the Comet QE
series HF antennae, I have had enjoyed very good performance
and security. If I park the car in an 'uncomfortable' area, I just
flip the switch and pop the mount and antenna off and place it
in the car. I have the 75m, 40m, 20m, 15m and 10m units
and all load up well. The ATAS looks as if it should work
just as well.

I hope this helps,

Bruno KC6WGR

Hi all,

Sorry to report that there is nothing wrong with my ft-100. It operates flawlessly in all modes and has exceeded all of my expectations. I think its the hottest thing on the market right now and I won't hesitate to recommend it to anyone.

I keep reading statements like "with all the problems I've been hearing about......." etc. If you are interested in the operation of the ft-100 or have any specific questions or concerns about it (I have the atas-100 antenna also), I would be glad to write back to you and give you some positive feedback from a very satisfied buyer.

The radio is getting way too much undeserved "bad press". I'm going to use it for field day this year and expect to do quite well with it.

I can be reached at : reedjc@...
or : ac6hi@...

73,
Joel (AC6HI)

Pres,

Will you be at Dayton Hamfest?
I will gather some splitters and get one to you there if you wish.
If not I will continue with shipping to you this week.

Mike:
That's what I thought when I first started using them. I suggest you try it though to see what can happen. It's not hard at all to get at least one side of the connector touching. If you end up getting the positive battery side touching the negative load side you'll have a problem, even thought the connector never makes it all the way in. I can't remember right off which side is the easiest to do this with, but I suppose if you are carefull how you select where the battery positive pin goes, you can minimize the risk.

Hello folks!

I want to buy the FT 100 in a few weeks and so i need some infos about it.

Is it possible to regulate the rf-output power (5-100 Watt ??) and how can i do that (set the rf-power in the menue ??) ??

What is the price of this rig in Japan ?

I hope somebody can help me. It is really hard to get information about this brandnew rig in europe.

tnx
73s ALEX from AUSTRIA

FT-100.....$1299<Picture: FT-100>

Yaesu is breaking new ground with the new FT-100. This radio offers HF, 6m, 2m and 70cm all mode operation, with general coverage and wideband receive from 100 kHz?970 MHz. The radio has a multifunction LCD display, and features automatic repeater shift for FM operation, Yaesu's ARTS (Auto-Range Transponding System), built-in CTCSS and DCS for FM operation, built-in CW memory keyer, Digital Signal Processing (offers bandpass and notch filters as well as noise reduction), dual antennas jacks (one for HF/6m; one for 2m/70cm), IF shift, IF noise blanker, 200 memory channels, speech processor, VOX and more. The radio is supplied with a hand microphone with up and down frequency controls.

Have heard plenty of horror stories on this site, but I have to say that I couldn't be happier with the FT-100. Have well over 50 hours mobile and probably 5 to 10 hours portable from an Indianapolis hotel room - all using the FT-100 and the ATAS-100 antenna (+ the radial kit when portable), and nothing to complain about - and everything to rave about. Better than expected signal and audio reports and tons of fun. Using the LDG AT-11 tuner when portable.

Would expect that I'm not alone, in terms of many hours of trouble-free enjoyment with this rig.

Hi Alex

The power is adjustable via the menu just as you said. I've no idea about the JA price but I would guess that it's quite a lot less than the UK price but the manual will definitely be in Japanese.

I'm surprised you can't get much information about the radio. In the UK most dealers have now got one and there is plenty of information on the web (in addition to this site of course).

I'm pretty pleased with my radio so far.

Dear Alex,

I have had my FT100 a month now and have used it both in the shack and mobil. It is a truly fantastic rig and I am very happy with it. In answer to your question the power for HF,VHF and UHF is highly programmable.

You program the power output from a menu in terms of % POWER..

HF 100% = 100 watts...
VHF 50% = 25 Watts...
UHF 50% = 10 Watts.. (IF) I remember the manual right, you get 100 watts hf, 50 vhf and 20 UHF at 100% power.

You can even a just the mic gain and the treble/bass/midrage response of the mic from a menu.

I have not had any problems with heating/ fan noise, lack of fan operation or receiver sensitivity that others have reported.

I did find the manual a little lacking, but I did figure out enough about the radio the first night I owned it to take the rig mobile and drive/operate at same time.

I have no idea what the price in Japan would be, but even if it is cheaper there, you have to get it back to were you live to use it and the customs fees and problems with transmitters in a foreign land need to be well thought out. I would hate to be detained in a foreign county or even my own for having made a mistake with import/export laws. A radio sold in Japan may not be the same type sold in your home country. This may cause yet another headache. What good would a radio make for use in the US be in europe. The 440 band would be all wrong and we need no 1750 burst so don't have one. The touch tone mica (I think)would be of little use in europe also.

I wish we could keep these post more in line with what is right/wrong with the FT100 and less
BRAND XXXX is better type bally who.. Every radio has its warts, one needs only to goto DEJANEWS and
type out the brand/model number of the radio in question and the word 'problem' and you are bound to find a few.

One other comment. All equipment imported to Europe must be CE tested and so marked. If you import a Japanese version it may not be CE marked and will probably be impounded as it is illegal to import and use such equipment even as an amateur unless it is assembled here by an amateur as a kit.

A long time ago I imported an ATU from the US and it was impounded for three weeks even though it's a passive device!

I have used Cinch-Jones 4 pin plugs in the mobile and in the shack for the FT-100 and the FT-890. Makes for easy movement back and forth.
BTW, made my first RTTY qso with the FT-100 today. Works fine on that mode.
If anyone needs the Rosetta Stone for the Data Cable (Pin vs Color Code), let me know.

Hi everyone,
Been reading the mail for several months now. Just got my FT-100 last week.
Doing Fine so far.
Does any know what type of Power Connector is used. I would like to get one or two
for other cars installations?
I called AES and HRO but they don't have any info. Was hoping maybe I could order
one from Allied or Newark if I had the Mfg and Type.

For all of you that have purchased and returned your FT-100 and then puchased the Icom, go subscribe to the Icom list and tell them that you have an Icom. We are happy for you and that you have a radio that you like. I have had my FT-100 running for 3 weeks now almost 24 hours a day and it is rock solid. There is no way that I can tell what the future will hold, but so far, so good! Let the rest of us enjoy the list and the radio.

What I did was get a couple of the Molex 2 pin 30 amp male/female plugs from the Shack. I cut the power cord about 4 inches below the Yaesu plug and then soldered this in line. When I move the radio from the house to the car and back, what I unplug is the molex connector and not the Yaesu connector. Then it becomes a simple matter to make up another power cord of the appropriate size wire and just terminate it in the same type of connector.

Ok guys the Idea of the Survey Is that you go to the URL on the survey and put your answer there so that we can get a quantitative result. Is this not clear on the origional survey posting ?
It is a feature of Onelist. It is cool if we learn how to use it properly.
So in future lets answer survey questions at the URL in the survey posting.
Please.

Thank you.

649. Re: FT-100 death (Number 3)

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-10 15:40:50 UTC
From: Thomas M. Schaefer
Topic: 565 Message: 649

My FT100 died in the first week. I sent it to Yaesu, they turned it around in 5 days, I have not had a problem since. Before we run around shouting about the impending gravitational attraction of the sky and the earth, let's look at this objectively. I am a tried-and-true ICOM person, but I liked the Yaesu better. The noise blanker is the best operating one I have ever seen. Regardless of what everyone says, there are plenty of us out here that have the radio and enjoy it. I have even had it die, but the way Yaesu took care of me and their customer service made me decide that this was simply one issue with a new radio. If anyone is under a false impression that there are not going to be problems with a new radio, you are mistaken. If you like the 706, then you will like the MKIIG, but one really does not have any relevance on the other. Problem with one radio mean nothing compared to another. ICOM could just as easily have a similar problem. Does that mean you guys will then say, the hell with Yaesu and ICOM, but Alinco?

Then again, there may be a large number of people on this list that find it easier to lurk around living vicariously through the experience of others when in reality, they will never own either radio. If that is the case, then I have exercised my keyboard needlessly.

For those that are truly considering the radio, go to a store, and operate both; side-by-side. Find a signal that is in the muck, and tune it in while pretending you are driving. Find a carrier on 40m and use the DSP on both. Get some pulse type noise near it and use the NB on each radio. Get an audio report using both radios. Whichever one you like, buy!

However, if you are going mobile, do not forget that that nice ATAS antenna that the store has, will only work on the FT100 (and the 847). You will have to come up with a less-integrated approach.

OK how many on this list are going to Dayton?

And bringing their FT100?

List your space number if you want others to look you up and chat.
I will be at 741-742.

How about a common hamfest frequency, for chat during and after
hamfest. Possibly a face-to-face after the flea market closes?

I suggest 10 meters, 28.456 ssb. Easy to remember, open to tech+,
shouldn't be as crowded as 2 meters!

For what it's worth, the six meter sprints occur saturday nite 7-11pm.
I plan to get on a make a few contacts. The hamfest and most of the
dayton metro area is grid EM79.

Another silly suggestion. I am going to add 'I own an FT-100' to one
of my many YAESU hats. I hope to see others at the hamfest. Help
start a trend!.

658. ATAS100 as a base antennal

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-10 20:24:54 UTC
From: John Woika
Topic: 658 Message: 658

Here is some input from today's experiment with an ATAS100 and a "FT847"

OK THE RESULTS ARE IN!!! I MOUNTED THE atas100 ON THE SAME POLE THAT THE
2 MTR J-POLE WAS HANGING ON.
>
the BASE HEIGHT IS ABT 30' ABOVE THE GRound LEVEL. THE FEED LINE IS 35' OF
CHEAP RG58 CRAP... THE LAST 10' OF THE MAST IS A 3/4" PIECE OF CONDUIT. THE
BOTTOM IS A 10 FT 2X4 MOUNTED ON THE FIRST STORY ROOF LINE. I STARTED THE
TUNING AND CHECKING ON 6 MTRS, OK 1:1, 10 MTRS THE SWR WAS 1:1, OK 12,
15 ALL OK 1:1, 17 MTRS OPPpps,, IT TOOK A LITTLE LONGER TO FIND 1:1.
IT DID ON THE SECOND ATTEMPT. 20 MTRS WELL, I THINK THE THING NEEDS
RADIALS. IT KEPT TRYING BUT WOULD NOT STOP AT 1:1, THE BEST IT FOUND WAS ABT
3:1,
>HHMMMMM... NOW ON 40, IT STOPPED TUNING AT 5:1 AND FLASHED "HI-SWR".
REMEMBER THERE ARE NO RADIALS. JUST A FUNNY LOOKING SAUSAGE HANGIN IN THE
AIR. I MIGHT TRY SOME RADIALS TOMORROW. OH, ON 40 MTR RECEIVE, A STATION
S-9 ON the ATAS100 WAS ONLY 40 OVER ON THE Full size dipoles at 40'!!!!!!
:-)

Hi all,

Has anyone tried an amplifier (mobile) yet with the FT-100? I am giving serious consideration to adding the Ameritron ALS - 500. I was just wondering if anybody had tried yet. I would love to talk to anyone about the pros and cons of adding an amplifier to a mobile rig.

Thanks,

Tom, W7YW

660. Search on ATAS 100 and the Outpost Tripod by Alpha Delta

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-10 21:12:20 UTC
From: Roland Haefeli
Topic: 660 Message: 660

Dear all

You might remember my posting of last Friday, asking whether the ATAS 100 can be mounted on a Outpost Tripod made by Alpha Delta for the Outbacker.

Despite being licenced for almost 10 years, I am a rather unexperienced ham. In addition, I live in cramped quarters and never had a chance to build up an HF station. That is why both the FT 100 and the ATAS 100 really could become my first HF rig.

Let me, therefore, share what I found out in the last two days about the ATAS 100 and the Outpost Tripod. I would be very much interested to get your comments, especially on:

- Is the ATAS 100 "compatible" with a 3/8-24 fitting (ie what does this mean?)
- Is a 50 ohm feedpoint impedance a perfect match for the ATAS 100?
- In a mobile setting, where I cannot drill wholes in the car, which mobile mount might be the best suited to do the job?

The official wording about this product (from the website http://www.alphadeltacom.com):

"The Alpha Delta Outpost?

Tripod/Ground Coupler Ground Mount System

The Alpha Delta Outpost? Tripod mount and ground coupling system was designed to allow any Outbacker mobile antenna to be used as an efficient portable or base station antenna. The Outpost can be easily transported and quickly deployed with an Outbacker antenna to provide effective communications from HF through 2 meters. Also, the unit is suitable for permanent or semi-permanent installations, especially where larger antenna systems cannot be erected. Idea for use with the OUTBACKER? OUTREACH? antenna, which is only 12 ft. tall and covers 160 meters through 10 meters.

Also, very little space is required to deploy the Outpost. The footprint of the Tripod is a triangle

approximately 5 ft. on each side. The unit folds into a package only 40? long and 10? in diameter and weighs only 15 lbs. It is constructed of aircraft grade 6061-T6 aluminum and stainless steel hardware. All movable parts are secured with wing nuts, so no tools are required for set-up or tear-down.

The antenna mounting bracket at the top of the tripod can be tilted over by removing one wing nut and bolt. This makes adjustments to the antenna easy and also allows the antenna to be lowered ?out of sight? when not in use.

The Outpost antenna mount is ground dependent and must be used at ground level. It will operate efficiently on lawns, patios, driveways, parking lots, etc. The Outpost incorporates fold-out ground coupler plates to efficiently couple RF energy to earth ground. The coupler plates act as the plates of a large capacitor and this large capacitance to ground results in efficient antenna radiation. The ground coupler plates together with the geometry of the Outpost provide a 50 ohm feedpoint impedance which is a perfect match for all Outbacker mobile antennas.

ALPHA DELTA OUTPOST? TRIPOD $199.00 PLUS $15.00 S&H"

Based on this information, I asked the following to sales@...:

"May I inquiry about the feasibility of using your product "outpost" together with the Yaesu Antenna ATAS-100? Can the two be used together? Any experience?"

Within a few hours (congratulations!), I got the following response:

" Thank you for your inquiry about the Outpost. The Outpost is a tripod ground coupler designed to hold any mobile type antenna with a 3/8-24 fitting in a portable, non-mobile application. Whether or not the Yaesu coupler would work depends on the type of antenna mounted on the Tripod. We have successfully used antenna tuners with mobile whips mounted on the tripod. We have not tested the ATAS 100 in this configuration."

Best regards and 73

To anyone that's interested I have put up some FT100 and ATAS pictures on my home site.

http://www.thebryantfamily.com/ft100.htm

I'll add my own pictures tonight if I can stay awake long enough.

Thanks for John, W8JW for his contribution. Anymore FT100 or ATAS or similar pictures are welcome. I'll add a JPEG of my mobile mic interface if anyone is interested.

I am not using a "mobile" amplifier, but I am using the FT-100 to drive
a QRO Technologies HF-2500DX and it is working just fine. Need to
reduce power output from the FT-100 to appropriate levels, of course, to
avoid overdriving the amp.

Hello,

There is a new survey for the FT100 community.

Do You Own A Yeasu FT100?

Possible answers are:

o YES
o NO

To vote, please visit the following web page:

http://www.onelist.com/surveycenter/FT100

Thanks!

I run a amplifier mobile with the FT-100. Its 600w just like the als-500, but mine is home brew. It works fine with the FT-100, there is no need for a extra keying circuit unlike the Icom, the keying circuit in the FT-100 will take the ALS-500 just fine. The only thing you have to watch out for when mobile is that you have a antenna capable of handling the amplifier. Most antennas say they will handle this power but fall short. Your ALS-500 will let you know when things are wrong, so make a wise antenna choice. 73s, Mike KF8MY.
P.S. I bought my FT-100 April 6th, and it has worked flawlessly everyday mobile on all bands in my Postal Mail car. It is one of the most exciting radios I have bought and I have had them all. May sell my 847 and get another one. 73s gang, Have fun,

669. Re: Infos about the Yaesu FT 100

> What is the price of this rig in Japan ?

I can answer that one, since I live there (of here :-)).

The ft-100 retails for about 120000 yen, which currently is about US$1000. This is for the Japanese version, carrying the J-mark. There was a new law a year of so ago, that made it illegal for Japanese radios to be modifyable for wide transmit in the V/UHF range. (Police, etc. was getting alot of intererence)

As a result the J-mark radios can only transmit 144-146 and 430-440 (HF 0-30MHz is okay, still)
This is not much of a problem for Europeans, but since I eventually will go back to the US, I want to be able to do full 2m and 70cm, not just part of it.

I looked, but I have not been able to get the export version here locallly. I called some of the biggest ham shops, and even asked Yaesu directly if there are dealers that sell the USA export version here and the answer was no. After some discussion back and forth, Yeasu offered to sell me a US version at 181000 yen, about US$1500 ! I decided to wait until my next trip to the US and get one there :-)

Incidentally, options and accessories are far cheaper here then in the US. All the crystal filters retail here around 7500 yen (< US$65), and separation kit is about US$55!

Hi

I've noticed that the fans are running much longer on HF than on VHF/UHF after just a very little transmission. On VHF/UHF the fans normally run for abt 10 secs after ending transmission but when I qsy to HF they go on for sometimes up to 15 minutes (at reduced speed however) - even when the rig is not warm. It's like the FT100 is trying to maintain the rig at a lower temp on HF than on VHF/UHF.

Is this normal for the FT100 ?

OZ5ABO, Per

My FT100 does NOT run long, more like the 10 sec or less delay on HF after short transmissions. Of course, if you are running mobile in a hot climate, you may be 30 degrees higher temp than I am before you turn the rig on. I am using the rig indoors under controlled temp conditions.

682. A 706G burns out its VHF final

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-12 20:57:29 UTC
From: Raymond Makul
Topic: 682 Message: 682

Not that it matters, but a friend of mine with a 706G had to return it because it suddenly stopped transmitting on 2 meters; burned out final suspected. He called Icom, and was told "it happens".

Oh well. I have a Harris commercial transceiver rated at 125 w. PEP and its heat sink is about 8 times that of either the 706G or the FT-100. I think that appropriate care and common sense must be exercised on any of these half pint radios.

683. ATAS100 results

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-12 21:14:54 UTC
From: John Woika
Topic: 683 Message: 683

Good after to all readers of this fine info site. Today I spent most of my day trying to impress "Our leaders of tomorrow" at an industry science fair. The Rochester Amateur Radio Assoc. and RDXA group helped man the booth.

I ran my FT847 in the building, the antenna was outside on my van. We used 125 feet of RG mini 8 between the 847 and the ATAS100.
From 9:30am local until about 1PM local, skip on 15, 17 and 20 meters was "decent". The children enjoyed their QSO with G4YIT, Ivar near Manchester. Then I QSYed and we QSOed with southern Florida, New Mexico and Colorado. When the skip faded I QSYed to 40 and gave the kids a good QSO show to Philadelphia and Newark NJ.

Attention ATAS travelers. Don't forget to take your barrel connectors and hunk of feedline with you on your next trip. Be careful so someone doesn't fall on your feed line. Tonight we go at it again from 6:30pm until 9pm Local. So W8JW really enjoys the ATAS100 on the van.
The 125 feet of feed line did not impact tune-up time with the antenna.
Any questions, just write to me at <JohnWoika@...>

Thanks to everyone who checked out the pictures on the site. As you no doubt spotted their were problems with them. I've now fixed the links and they should work properly.

687. Power out put on 6 mtr

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-15 02:22:48 UTC
From: n0isv@xxx.xxx
Topic: 687 Message: 687

Has any one else had power out put problems on 6 mtrs?
The specs state- 100% = 100 watts
50% = 50 watts etc, etc.
With a meter and dummy load, I got following...
100% = 85 watts
50% = 40 watts
25% = 20 watts

All other HF,VHF,UHF power specs seem ok and are at correct levels!

The 2nd set of menu functions, F01-F59 may have a place to fine adjust the power out put settings?
I can not confirm this, as Yaesu will not give out how and what the F01-F59 fuctions are for.
But F16,F17,F18 and F19 seem to be for 50 MHz PO??
10w - 100w.
Has anyone made an adjustment to any of the PO settings in the F01-F59 menu? If so, does it work??

Hi Wayne

Funny you mention it - just measured my FT100 with a dummyload and I get abt the same as you on 6M. In addition it get aprox the same on HF - only on VHF/UHF do I get pwr according to specs.

However I wouldn't bother trying to adjust the pwr via the F-menu since the difference between 85 W and 100 W must be unmeasurable from the recipients point of view. I think I'll look into improving my antenna cable instead...

The only F-setting I've changed is the setting for the S-meter reading which works fine.

On this thread has anyone checked their frequency accuracy? I'm 1kHz low on 2m FM. I haven't checked power output either. I also adjusted the S meter and it's fine now.

I have checked my Ft100 with a recently calibrated freq counter. If
adequate voltage and current are available to the radio I was within 20 hz
of display frequency on all bands. Radio was tested inside car with the
temp being about 75*F. The same radio was a much a meg off freq on FM
before upgrading the power feed from 12 gauge wire to 6 gauge. While ARRL
says this radio will pull 17 amp on full power transmit I am pulling more
in the neighborhood of 20 amps. My power cord runs 17 feet to the battery
so I have some lead loss...

Thanks for the report Allen. I really can't see how the frequency is going to be affected dramatically by the power supply unless the voltage is really low. In anycase when I adjusted the offset for the 2m band the 70cm frequency moved. I'll take my counter down to the car in a while.

Noted on the current consumption. For the record I have some heavy duty cable direct from the battery that was running my IC706 and a Mirage 160W linear without voltage drop when measured so 50W on the FT-100 should be OK. I'll check the voltage in any case. The frequency is correct on sideband by the way.

Im wondering if anyone who has a ATAS-100 if there is a diagram of the circuit thats inside it. Also can someone tell me when on 2m and 440 if the antenna stays fully retracted on both bands. I am thinking that this antenna when going to 2m retracts all the way and then runs a multiple of 2m on 440. That means its stays fully retracted on both, it doesn't move when switched from 2m to 440. Can anyone confirm this for me.
Also does anyone have there radio opened up for transmitt, can the ATAS-100 tune anywhere then?(between 40m and6m) I notice the processor does not let it tune on any bands lower than 40m.(ie 80m and 160m).
I am trying to make my 10m thru 160 screwdriver auto tune like the atas-100,this is possible right now 10m thru 40m. But the FT-100 processor tells it not to tune when its not on 40m thru 440. Thanks,
Mike...

695. setting power output

Yahoo group: FT100 (1998 — 2000)

From: Robert Gauss
Topic: 695 Message: 695

The manual states that the power output can be set for each power mode.

When I try this with my radio I was only able to get an independent power setting for AM. What ever was set for any mode applied to all modes.

Well at Dayton at the Yaesu booth I was finally able to get some one to confirm that this is normal operation, the manual was incorrect. To bad, I wanted to set the continuous modes like FM to lower power and keep the SSB power up at 100%. Its not a big deal to change the powers when I want to but the extra feature would have been nice.

Bands stunk over the weekend at the hamfest. 10 meters seemed dead until sunday afternoon when some LU's were leaking in as we were driving home. Got a 5-7 report with nice sounding audio comment from one of them.

Did the 6 meter sprints for about an hour. Work 10 contacts, all Ohio except for W4RCC in florida. Did hear some zeros come a go. No real opening.

Bought MFJ extension speaker. That little speaker in the radio hard to listen to. The MFJ sounds much better but is still small enough to 'match' the radio and fit in the carry bag I keep my radio in.

697. FT-100 at Dayton

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-17 13:14:12 UTC
From: Paul R. Valko
Topic: 697 Message: 697

I am very interested in what other Yaesu FT-100 owners have to say about their experiences at Dayton.

Lowest Price I saw was $1229 + tax

The nice guys at the Yaesu booth were no doubt swamped with questions regarding the failure rate on the rig. I wish I could have hung around a bit to hear how they handled that.

I still have the intermittent UHF TX problem. Yaesu claims there is a mod for that which includes a cap and moving some wires. I'll probably ship mine back next week... or ... I may wait a couple months to see if any other "inprovements" are in the works.

On the way down to the Hamvention, I noticed that my VHF output had dropped to about nothing! That's according to the power meter on the rig. I don't know if it really was down or not. It was fine this morning, driving into work, but I was not transmitting for as long as I had been while driving down there Thursday afternoon and chatting on .52 simplex.

There was a 6M FM repeater right across the street from the Hamvention, I had several nice QSOs with folks there. Worked a few VX-5 and IC-T8 handhelds that were bought Friday for those folk's first 6M contacts.

And finally, I bought the new Comet HF-CVU mobile whip to replace my Comet HF-CV. It just came out last week and it works great on 40M, 15M, 10M, 6M, 2M, and UHF! On Friday afternoon, I sold my CA-HV to a VE3 op. It doesn't do the WARC bands, like the ATAS100, but it costs about $200 less.

Roland good morning OM. I use the ATAS100 on my Ford van with the FT847on 40 meters through 6 meters, NO problems. At home I put it up on a 9 meter high pole, With out radials it only worked 20-6 meters. The SWR on 40 was not very good. I think it would work better if it had three radials for 40/20/17 meters.

John-
I would like to change to a 49" whip, but the tapered whips used on my Larsen antennas does not fit in the existing hole. Did you find a whip that does fit, and if so where and what is the maker / model? If not, did you ream out the hole to fit a larger diameter whip?
Thanks,
Tom KB7EFZ

704. antennas

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-17 19:57:29 UTC
From: Pres Waterman
Topic: 704 Message: 704

Well, I have seen some positive comments about the Comet HF-6m-2m-450 combo antenna, and as I figure it the mount/coax/diplexer are a wash (needed for both) so the cost difference between the fixed Comet and the ATAS-100 is exactly $150.

The benefit of the Comet: slimmer, shiny, can have the top stuff (coils) removed to leave 6-2-440 if HF not needed, cheaper. Covers 40-20-15-10-6-2-440. Possible 80 option, I forget. 440 is a trapped 1/4 wave.

ATAS-100: tunes to more bands in between. Covers 40-30-20-17-15-12-10-6-2-440. Who knows what electrical confoguration for 440?

Anyway, it is unlikely that any ONE person has tried both, but I just thought I'd ask if there was a clear suggestion.

BTW, I enjoyed meeting 2 list members near the Dayton Yaesu booth, it's a shame we didn't get the word out earlier.

Pres

I've heard that the ATAS-100 does not perform as well as a separate 2m/70cm. I run two antennas over here. I also have the VHF/UHF antenna on the car (it's a quite ancient Comet dual bander) while I remove the ATAS-100 when I park somewhere suspect for long periods. The multiband comet sounds good. I don't know anything about it yet. Do you have to stop to change bands (strap inductor?) or is it truly multiband (doubtful). I like the ATAS because I can tune anywhere, 40 and up. I do miss 80m mobile a little though.

For whats its worth, I run a 3" diameter screwdriver antenna for 160m thru 10m,(but you could use your favorite HF antenna) and I run the Comet tri band antenna (sb-15) for 6m, 2m, and 440. I use a duplexer to tie the ft-100 together with all the antennas and can work 160m thru 440 without stopping the car. It works great. 73s Mike, KF8MY

Mike

Any chance of some pictures of the setup? It sounds very acceptable to me
for a complete mobile station, although a 3" antenna might be rather
daunting for the smaller European cars. (we do have big ones as well!)

The main advantage is that the antenna is designed to be controlled by the FT100 (or FT847)
All tuning / motor control is done through the coax. It works automatically when you hit the tune button. You must have a proper installation of course.
Maybe Mike can alter one of his designs to suit the Yaesu control methods.

From: Robert Gauss [SMTP:w8cbr@...]
Sent: Monday, May 17, 1999 7:48 AM
To: FT100@onelist.com
Subject: [FT100] setting power output

From: Robert Gauss <w8cbr@...>

The manual states that the power output can be set for each power mode.

When I try this with my radio I was only able to get an independent
power setting for AM. What ever was set for any mode applied to all
modes.

Well at Dayton at the Yaesu booth I was finally able to get some one to
confirm that this is normal operation, the manual was incorrect. To
bad, I wanted to set the continuous modes like FM to lower power and
keep the SSB power up at 100%. Its not a big deal to change the powers
when I want to but the extra feature would have been nice.

Bands stunk over the weekend at the hamfest. 10 meters seemed dead
until sunday afternoon when some LU's were leaking in as we were
driving home. Got a 5-7 report with nice sounding audio comment from
one of them.

Did the 6 meter sprints for about an hour. Work 10 contacts, all Ohio
except for W4RCC in florida. Did hear some zeros come a go. No real
opening.

Bought MFJ extension speaker. That little speaker in the radio hard to
listen to. The MFJ sounds much better but is still small enough to
'match' the radio and fit in the carry bag I keep my radio in.

I couldn't set the power independently for SSB and FM either.
Which band(s) did you try? I tried 2m only as I recall.

713. Re: setting power output

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-17 23:14:58 UTC
From: Walsh, Tom
Topic: 695 Message: 713

My FT-100 behaves as Robert describes. The manual, when I first read it, appeared to imply that one could set the power to a different level for each of {SSB, CW, FM, AM}. A careful re-reading indicates that it could be interpreted to be each of { (ssb, cw, fm), am } (which is in fact what the rig does). I'll guess that this is because AM *must* be set lower, while the others *may* be set lower.

The bands were really hot last week, with a 6m opening from OR to CA, AZ, and perhaps others. 10m had a sporadic E opening late one evening, in which Idaho and California were workable from Oregon. Toward the end, there was a lot of deep QSB. This morning, at about 8am local, South Florida was booming
in on 10 to OR (where it was foggy and raining).

Haven't heard a 2m band openning, but refered to my log from 6/25/1988 and saw that I worked stations as far away as Illinois that day. I think that was tropo, but can't remember for sure.

Subject: [FT100] setting power output

From: Robert Gauss <w8cbr@...>

The manual states that the power output can be set for each power mode.

When I try this with my radio I was only able to get an independent power setting for AM. What ever was set for any mode applied to all modes.

Well at Dayton at the Yaesu booth I was finally able to get some one to confirm that this is normal operation, the manual was incorrect. To bad, I wanted to set the continuous modes like FM to lower power and

keep the SSB power up at 100%. Its not a big deal to change the powers when I want to but the extra feature would have been nice.

Bands stunk over the weekend at the hamfest. 10 meters seemed dead until sunday afternoon when some LU's were leaking in as we were driving home. Got a 5-7 report with nice sounding audio comment from one of them.

Did the 6 meter sprints for about an hour. Work 10 contacts, all Ohio except for W4RCC in florida. Did hear some zeros come a go. No real opening.

Bought MFJ extension speaker. That little speaker in the radio hard to listen to. The MFJ sounds much better but is still small enough to 'match' the radio and fit in the carry bag I keep my radio in.

714. Power Level Settings

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-17 23:38:58 UTC
From: Richard W. Solomon
Topic: 714 Message: 714

Read the manual guys, it's quite clear. Page 47, second line ..."the MENU system allows the HF, 50 MHz, 144 MHZ and the 430 MHz power levels to be set individually"...
The next sentence states ..." in each of the above band groupings"...
The manual IS NOT incorrect.
See menu #21 through #24 on page 82 to see it stated another way.

OK so reading the manual

"Moreover, the FT-100 also allows you to set the SSB/CW/FM, and AM power levels individually in each of the above band groupings."

This is ambiguous, since it could be interpreted that the power levels for EACH mode SSB, CW, FM and AM can be set separately. I.E. 100W for FM, 50W for CW, 20W for SSB and 10W for AM. The use of '/' is inappropriate in this context as it has no defined meaning. It would have been better if they had explained that the AM power level could be set independently from the other modes, ie either or as it were. Maybe using brackets would have helped who knows?

Of course a simple table would have made it even clearer.

I see the confusion in both camps. For what it's worth I too had hoped that the power level could be set on a mode by mode basis.

So the manual is not 'wrong' it's ambiguous.

Hi Deb,

There was no schematic with my ATAS-100.
Yes the ATAS-100 is full retracted on 2 M and 70 Cm. I checked the SWR with the Autek RF-5 Analyst and found it to be Very good on both bands. There was no tuning needed anywhere I went on either band. In fact, on 6-meters I detected no change in tuning. The latter may of course very with the installation and vehicle Later while testing the antenna, I worked a New Jersey station on 6 meters. He gave me an S2. I was inside the car garage with the door down and the engine off.
I have the ATAS-100 mounted on a Ford Ranger about 20 inches back behind the cab on the passenger side.

Hope this helps, Lamar

717. ATAS100 with 49" whip

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-18 01:10:12 UTC
From: John Woika
Topic: 717 Message: 717

Tomas Walsh good evening, sry I had too many things to do today. OK on the whip , it is an old 2 meter 5/8s or 7/8s that was laying in the corner. YES you are right other whips are too big in diameter. So what I did was, I have a set of grinding wheels for lawnmower blades. I set the tool guard very close to the wheel. Maybe 1/16", then I put the the large end of the whip in a vise grip to keep it from turning too fast. Then a little at a time I was able to shave off just enough to fit the whip socket on the atas100. I also thought about drilling out the socket just alittle bit. However I am not a dentist, too clumsy. hi hi

Once the whip was seated all the way I tightened the allen screw and Walla. All bands work from 40/6 and some stops in between...

Radio Shack has a 59 " whip from a CB antenna but the replacement whip was $20, way too much for me.

> exactly $150.

Does the ATAS100 come with a duplexor? My Comet was $119 + tax at Dayton,
sold the non-HF version for $80 and gave the guy all the new parts, never
even opened the bag, I just took out the part with the UHF coil on it and
put my old part in the new bag.

So I was thinking the ATAS was $300 + $59 for the duplexor and I was $200
ahead. Was I wrong.

Not that it matters, I'm happy with the Comet. It is very clean looking
and doesn't ugly up my Grand Prix.

Hi there,

I have the ATAS-100 that I mount on the back of my camper. I used it this last weekend during the local 6 meter sprint and worked 6 meters, uhf, vhf, 30 meters, 40 meters, and 15 meters all with great results. I did attach 40 meter radials to the antenna base after installing it and it was up about 25 feet and worked great.

Pres,

I have used both the comet and the ATS100 the comet is a poor excuse
for an HF antenna. The results on vhf and uhf are fair. I found the ATS100
a big improvement. I also have an outbacker and a QMS2 the best of the lot
is definitely the QMS2

Date: 1999-05-18 04:04:05 UTC
From: Mark Johnson
Topic: 720 Message: 724

Hi Mark,

Can you tell us a little more about what type of noise you are
experiencing? Noise is inherently Amplitude Modulated and does usually not
effect FM unless it is extreme. Or if the noise is something like
alternator whine it is likely coming in on the DC power leads and is
effecting the audio stages not the rf stages of the radio.

Cliff gave the best answer / explanation of the situation. I never questioned the power setting by band, only by mode. I can understand the ambiquity in the text of the manual now. I was, and I think others are, confused by the fact that in the power set menu you can change modes between SSB, FM, CW and apparently set the power for each. It just that what ever you set applies to all, (except AM). The YAESU guy at the booth says that is been consistant with the way YAESU radios have worked in the past.

729. New Comet CA-UHV

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-18 13:26:42 UTC
From: David Cooper
Topic: 729 Message: 729

All-

Got my ft-100 into my Jeep Cherokee over the weekend.
And got a Comet CA-UHV on a foldover gutter mount,
which seems to be working out well. The foldover
was required due to having to fit the parking ramp
at work, which makes big antennas tough! Hardwired
10 gauge for power with option to add my dual-band FM
rig back if desired.

The comet does 70cm/2m/6m/ and any two of:
{40m/20m/15m/10m}, though it seems like I should be
able to fabricate an 80m coil for it as well.
I didn't realize it was 'just out', & got it for about
$130 locally. The 20m coil is an option that I'll need
to look for. Bandwidth on 40m was about 80 khz @ <=2:1
SWR.

Hi Terry,
I really fretted if I should get the ATAS 100 or one of the standard screwdrivers. I finally picked up an ATAS 100 last week. I do want to be able to work 80 for ARES so I will pick up a ham stick for 80 and then figure some way to put it on the ATAS mount when I need to use it.

There were two reasons I got the ATAS 100. The first was the fact that the radio was designed to use it. You only have to run coax to the antenna and not separate 12 volt leads. You also don't have to mount a separate switch to operate the antenna drive. The tuning is automatic with the ATAS 100 and the FT-100. You set the radio to "tune" and it will tune the antenna to the best match. With a standard screwdriver you have to manually tune the antenna while watching the swr. Or have pre set marks on the antenna which requires that you be able to see the antenna when you adjust it. However, I have seen a circuit that will do some memory tuning and I just saw and advertisement for a screwdriver auto-tune for the ICOM-706xxx.

The second reason was the sexy size. The standard screwdriver takes up a lot more real-estate on your vehicle. I usually adhere to the principle of the bigger the antenna the better. One of the biggest advantages of the screwdriver over other antennas is that it is center loaded rather than base or top loaded and it has a longer whip on top. Center loaded antennas tend to be much more efficient than base or top loaded. At first I was concerned that the ATAS100 was base loaded because of it's size but after looking at one I saw that it is center loaded. I also talked to several folks who have used them and most were very happy with their performance.

Any way that's a lot from somebody who hasn't even put it on his Explorer yet. I will post more after I have given it a road test or two.

From: Walsh, Tom
Topic: 720 Message: 731

Exactly! Well described Mark/0. Mark/1 - NB is IF stage impulse noise remover.
First thing to do is fix the conducted or radiated AF noise. After that, if you
are interested in what the rig can do with FM, note that DNR does work at AF, and
can help with FM. On faint, low quieting signals, the DNR will significantly
improve the readability. I've been able to use the FT-100 to recover a signal
from a distant repeater which appeared as white noise on the FT-8100 and on the
FT-100 when the DNR was off. With DNR on, and adjusted to the best audio setting,
the signal went from 'white noise with a hint of quieting' to about a q4 copy.
Enjoy,
Tom, KB7EFZ

Subject: Re: [FT100] Noise blanker on FM?

From: Mark Johnson <silversq@...>

Hi Mark,

Can you tell us a little more about what type of noise you are
experiencing? Noise is inherently Amplitude Modulated and does usually not
effect FM unless it is extreme. Or if the noise is something like
alternator whine it is likely coming in on the DC power leads and is
effecting the audio stages not the rf stages of the radio.

From: Richard Spille
Topic: 732 Message: 732

I reported back in April my FT-100 died. It would not receive on SSB,CW, or AM. Yaesu
got it April 28. It was back in my hands on May 11. I installed it back in my car and have
been happily using it since. The paperwork that came back with the radio says they
replaced defective parts on the PA unit (IC IR3M03N2 and chip cap, RMC1/4), installed all applicable updates, and tested all function and aligned unit to specs.
Even with the problem I had I am very satisfied with the radio. I use it mainly mobile with
the ATAS antenna. I like 10 meters and have worked South America, Europe and Australia.
In all cases the stations came back to me on the first call.

Slightly interested here. How can a noise blanker (an amplitude modulation type filter) affect an FM signal? What kind of noise are you getting on FM?

735. ATS100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-18 23:16:02 UTC
From: kc7gf@xxx.xxx
Topic: 735 Message: 735

Still waiting for my FT100 to arrive, should be here tomorrow. In the meantime I picked up the ATS100 and experimented a little bit. 12 to 14 volts makes the antenna extend 11 to 9 volts is a dead zone and 8 or lower makes the antenna retract. Current draw was less than 200 mills in both cases. Hope I can check it with the FT100 tomorrow.

Art, KC7GF

736. ATAS-100 optimization

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-19 02:22:46 UTC
From: emoxon@xxxxxxx.xxx
Topic: 736 Message: 736

Hello All -

Just joined and am doing some catching up. Re Joe's ATAS-100 frequency 'optimization' question...

If you tune the antenna to the low end of 40m, then slide the rubber boot up off the stalk, you can see the fully-extended coil. The winding pitch varies so as to provide finer tuning resolution on 40, 20, and something higher, presumably 15. Finer means less-drastic resonant-freq change per unit of axial movement. In between these 'sweet zones', tuning changes rapidly with position, so it would seem more likely that the point at which the motor stops could be off from where the detected swr was minimum. This explains why tuning on 30 and 17 would be different from other bands. From what I can see of the winding looking up inside the boot, from 15 up shouldn't be so tricky, so this doesn't quite explain the Yaesu disclaimer re 12.

There is another thing about the tuning between the sweet zones. The sliding contact to the coil consists of 4 spring-loaded ballbearings riding the winding. Where the turns are more densely packed, it looks like a ball can bridge and short a turn, introducing some additional loss at those in-between frequencies.

From: Scott Willis
Topic: 737 Message: 737

I guess it was my turn, my FT-100 finally died today, it slowly quit, which I thought was weird, I thought it should either work, or not, but it slowly faded away over a two day period. It's now putting out 0 watts on 2 m and 70 cm and is displaying the SWR-X icon for BAD SWR, but the SWR is actually good, not bad. I've been lurking on the list for a long time, reading everyone's reports on the FT-100's that swallow their gum and choke on it... and I've been very happy that mine hasn't had a single glitch yet, counting my blessings. But the inevitable happened, and it's gonna be shipped back to Yaesu as soon as AES mails me a copy of my receipt which Yaesu needs (and I threw it away). When I get it back, it might go up for sale! I mean, I can get two FT-8100's for the price of this lemon, and then I would have 35 watts on UHF (more than the FT-100) and get Cross-Band-Repeat also.

Very, very frustrating.

Scott

Topic: 736 Message: 739

Hi Ed, I think your thinking correct over all. But the (finer)or closer the turns, the trickier or the sharper the resonant point is, which makes it harder to tune at the same antenna motor speed. If those turns are closer on 17m than on the higher freq. than that makes it harder(or closer) to find resonance with auto tuning. Thats why Yaesu states you my have to manually touch up the antenna. Also if the antenna Q is high at that freq. the band width is narrower thus making it harder to tune. (higher the Q, more efficient the ant, and narrower the band width.)
As for the longer whip that the other gentlemen put on, you must remember the whip length affects tuning on the higher bands. The antenna has to be that length to be able to tune up there. 73s, Mike..

From: Robert Gauss
Topic: 531 Message: 740

I will try to give a long engineering explanation which basicly ends with 'it depends'

Moving the loading further up on a short antenna raises the radiation resistance and the ratio of radiation resistance to loss resistance is basicly effiency. (good)

Moving the loading further up on a short antenna means the part above the coil is smaller therefore the capacitance of it is smaller and the coil requires more inductance to tune. More inductance at a constant Q means more loss resistance. (bad)

Moving it up usually requires a physically smaller coil for mechanical reasons. A physically smaller coil usually has a lower Q for the same inductance. Lower Q means more loss resistance. (bad)

Capacity hats are often used to add capacity above the coil and reduce the inductance and the loss in the inductor. (good)

As with most designs, compromises are made. Current technolgy seems to favor the compromise with the coil somewhere near the center.

As a note, I am helping a group of local hams prepare for the advanced exam and one of the questions in the pool is 'where is the loading coil placed for best efficency' and the offical answer is 'near the center'.

Bob

Ahhh! Have you read my earlier messages? That is EXACTLY what mine has done. The UHF quit first (actually... it is intermittent and can be restored with a whack to the case).

On the way to Dayton, the 2M side SLOWLY dropped to zero after a few long QSOs while driving.

At Dayton, the tech said that there is a fix involving a chip cap and moving some wires. I bet the RF deck gets replaced too... I've heard that on several other failures.

I'm waiting a couple more weeks before sending mine in to see if any other glitches get cures. I must say I'm not quite as bitter as you seem over the loss. I bought an early 847 and sent it back almost a year later to get all the updates installed.

743. 1750 Hz

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-19 16:20:58 UTC
From: Brix & Bitz
Topic: 743 Message: 743

Cliff,

Recalling my 1750 HZ tone burst problem (being more like the 1800 Hz) I finally went to my dealer for fixing the problem. The solution is that the CPU must be changed in order to get it fixed.

According to Yaesu in Netherland (European Servicenter ?) they are almost finished producing an updated CPU which among other things should solve the tone burst problems.

My local dealer didn't know what other things the updated CPU can cure/improve but he will try to get that information when he receives the CPU for my FT100. I'm interested to see what that might bee...

So far I haven't had any other problems with it - I'm just using it a lot on all bands...!

I was however annoyed by the fans running almost all the time on HF and only for some 10 secs on VHF/UHF so I mailed Yaesutech. Just got an email back today saying that the fans are supposed to run almost all the time on HF (on low speed) to prevent a potentiel overheating situation. Since the low speed isn't annoying I'm pretty content with that.

Regards
OZ5ABO, Per

745. Re: ATAS-100 optimization

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-19 17:03:45 UTC
From: Joe
Topic: 736 Message: 745

A few other thoughts on this -- adding a longer stinger
could allow "optimization" on bands other than the ham bands (ie, for Marine or other HF use) but could compromise HF ham band performance.

I would think that modifying the antenna and using a longer stinger (ie, 49 inches for example) would modify the tuning and possibly prevent "sweet spots" within the ham bands -- in other words, antenna efficiency may decrease despite the longer whip -- due to loss incurred with an imperfectly matched antenna system as the result of the overshoot due to non-linearly wound antenna coil design and moving point of resonance past a "sweet zone".

Not sure if one would note a major difference or not in terms of field strenght.

To the guy who bought an ATAS100 and plans to run 80M with a hamstick, I would suggest another antenna. The hamsticks are horribly inefficent on 80M -- as are the Hustlers, and other small-coil design antennas. To get decent 80M performance, the only real solid performers are: bugcatcher and screw driver capable of tuning 80M.

As for HF flexibility, I almost think the "generic" screw driver antennas are a better option. Certainly, they will radiate more RF than the ATAS100 due to increased physical size and coil efficency. They will tune 80M, and, they will continuously tune any HF freq without this "sweet spot" issue.

Of course, the ATAS100 will tune the VHF and UHF band as well, and is an all-in-one package, which is important to some hams.

For serious HF mobile operation (ie, spending more than a kilo-buck for a mobile radio) I'm beginning to wonder if this ATAS100 antenna is "too much" of a compromise in aesthetics to be a real player.

I will bet hamsticks radiate as much, or more, field strength on 20M thru 6M as the ATAS100. Anyone take one of these to a shootout for comparison?

Keep in mind all these " I worked XYZABC" comments are
without comparison to another antenna, and, we are at
a high point in propagation, so, even a wet noodle
will work DX on the higher HF bands.

Not being negative, just looking for some objective
comparisons.

Joe-
Some of your thoughts seem based on "sweet spots". The sweet spots, as described here, are areas in which the tuning 'rate' is slow. Any place outside a sweet spot doesn't exhibit worse performance, but rather 'more touchy' tuning. If you go "up, up, up <SWR indicator moves up>, dn, dn, dn, dn, dn, <SWR indicator went down, and is not up>, up, up, up" where "up" and "dn" are short taps on the tuning up and down keys, you will have tuned the antenna in a non-sweet spot. Addition of a longer whip increases the RX capture area. That's what I'm after. Using the ATAS, I'd say it's not a compromise at all, unless you compare it to a 3" diameter screwdriver with 102" or longer whip... (Which wouldn't be an easily integrated device even on my extended cab full size 3/4T P/U.

Subject: Re: [FT100] ATAS-100 optimization

From: Joe <k7joe@...>

A few other thoughts on this -- adding a longer stinger
could allow "optimization" on bands other than the ham bands (ie, for Marine or other HF use) but could compromise HF ham band performance.

I would think that modifying the antenna and using a longer stinger (ie, 49 inches for example) would modify the tuning and possibly prevent "sweet spots" within the ham bands -- in other words, antenna efficiency may decrease despite the longer whip -- due to loss incurred with an imperfectly matched antenna system as the result of the overshoot due to non-linearly wound antenna coil design and moving point of resonance past a "sweet zone".

Not sure if one would note a major difference or not in terms of field strenght.

To the guy who bought an ATAS100 and plans to run 80M with a hamstick, I would suggest another antenna. The hamsticks are horribly inefficent on 80M -- as are the Hustlers, and other small-coil design antennas. To get decent 80M performance, the only real solid

performers are: bugcatcher and screw driver capable
of tuning 80M.

As for HF flexibility, I almost think the "generic"
screw driver antennas are a better option. Certainly,
they will radiate more RF than the ATAS100 due to
increased physical size and coil efficency. They will
tune 80M, and, they will continuously tune any HF freq
without this "sweet spot" issue.

Of course, the ATAS100 will tune the VHF and UHF band

Tom and Joe re: 49" whip on the ATAS100, I like to experiment, and this additional 13 inches, does not seem to bother the tuning speed or SWR curves. (Sweet Spots???) I thought that was the optimum seating location for surround sound!! I will recheck the resistance/SWR at 7.005 with my MFJ 259 Analyzer and verify any changes in length of coil between 36" and 49" whip.

Yes the "Bug Catcher works great", but instant QSY meant STOP, get out and change position of the alligator clip!! :-)

I have seen that feeling Scott, a friend at Dayton went back and forth from Yaesu to Icom booths trying to decide on 100 or 706. He bought the 706IIG. When he got back he ran the rig for about 3hrs and trying all the bands. While on 2m he has lose all output VHF and UHF. So it can happen, but you never want it to happen to you.. 73s Mike

749. Re: 1750 Hz

Yahoo group: FT100 (1998 — 2000)

Topic: 743 Message: 749

Thanks for this update, Per. It sorts out a long standing debate between myself and another. I guess the mod must be purely software then. Glad it is sorted out. UK repeaters now have CTCSS as well as 1750Hz but I usually can't remember the CTCSS tone freq so I use the 1750Hz instead.

I'm sure everyone on this list would be keen to hear about the improvements, if any.

I've started to notice some quite annoying in band signals generated by the radio itself. In particular 433.1375 MHz is 20 over 9! No HF signal problems detected. As it happens there are no repeaters on the 70cm frequency in question (or near by) but it is starting to annoy me. I have to be honest I haven't yet established that it is the radio. It's possible that the car is generating something.
The fans don;t annoy me as I only use the radio mobile and the car noise is much louder that the fan noise. Mind you my IC2KL HF linear at home has fans that suck the cat off of the desk when they run so maybe I'm just 'fan deaf'.

Anyone know what the programming or mod is for 70 Mhz transmit?
I believe the UK version has 10 w available on that band .
Would be nice to have this available for overseas travel.

752. Re Noise blanker on FM

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-20 00:52:24 UTC
From: k1map@juno.com
Topic: 752 Message: 752

Hello Mark & Interested subscribers
Ignition noise is a common problem on 6 meter FM.
The noise I have a problem with is standard electronic ignition hash (ford v-8). No alt whine, at present, either on rx or tx.
The 706 has a NB that works (poorly) on 6m FM, but the NB on the FT100 will not turn on when the rig is on 6m FM.
Rigs like the (FM only) Kenwood 741/742 series have fairly decent built-in NB and commercial equipment (usually) has NB circuitry.
This was one of the features I was hoping for an inprovement on over the 706
Has anyone determined which adjustment is best for noise reduction on 6m FM on the Ft 100?

Thanks 73
Mark Casey K1MAP FN32sb

753. Re: ATAS-100 optimization

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-20 15:03:59 UTC
From: Joe
Topic: 736 Message: 753

Hi Tom, Thanks for clarificaton, but still I dont get the mechanics of the antenna. Is this a stepper motor? Or continuously variable?

anyway, comments follow:

> The sweet spots,
> as described here, are areas in which the tuning
> 'rate' is slow.

Right. Except that having a more "touchy" tuning point means more margin of error in getting a perfect match where the SWR is not exactly matched, nor where the stepper motor (if used) is exactly setting the tuning "shorting bar" at resonance. I know a VSWR of 1.5:1 is a mere 4% reflected power, so as I said, this may not be a notable difference, but something to consider. Of course, base impedance also effects antenna resonance, so, even with the standard whip, on some mounting locations, the antenna may resonate within the ham bands at a point other than within the "sweet spot" tuning zone. Now I am left wondering why Yaesu "optimized" the antenna. What was the point?
> Addition of a longer
> whip increases the RX capture area. That's what I'm
> after. Using the
> ATAS, I'd say it's not a compromise at all, unless
> you compare it to a
> 3" diameter screwdriver with 102" or longer whip...
Agree.

I bet the bug catcher with 4 foot lower mast, 12 inch coil (3 inch diameter) and 5 foot upper whip would outperform the ATAS100 on 40M. Just a guess, though. Reasoning is the efficiency of the coil. I bet there's
a fair amount of loss in the ATAS100 coil -- the fact that the center of the ATAS100 is not air. How tall is the ATAS100? I seem to remember last year seeing it at Dayton last year, and it was about 7 feet long total.

I was just refering to the optimum antenna if spending 1400 bucks for a mobile HF rig. I (personally) use the best antenna I can afford (then again, I'm from

the school that thinks multi-kilobuck rigs are worthless without good antenna) which happens to be the "get out and change the 'gator clip bug catcher" . What can I say -- it was cheap and it works well.

The ATAS seems to be tops in the league of hamsticks or outbacker or hustler antennas in terms of size and radiating efficiency (and hence field strenght performance, assuming both are tuned to resonance), but in the league of the large mobile antennas like full sized bug catchers and screw drivers, the ATAS100 probably wont play as well on 40M. Higher bands will likely show little if any difference. This is from an RF efficiency / radiation standpoint. Not saying anything about how an OM wants to operate (I dont mind getting out to change the 'gator clip in the rain, some do...)

Understanding that EVERYTHING is a compromise, the ATAS100 is fine for those wanting all-in-one antennas. I'd argue that it's the cleanest, simplest approach to all band mobile operation and probably earns points as an XYL pleaser. But, it IS a compromise and those wishing to get *maximum* RF *bang for the buck* should chose either bugcatcher or full size screwdriver. Same reason I dont run dual-band antennas for VHF-UHF. Yea, my truck looks like a porcupine, but system works!

Those who have run mobile believe the hamstick/hustler type antennas work fine on higher bands but fall off on 40M and stink on 80M. This has been my experience.

I would be interested to know the efficiency of the ATAS100 on 40M and a comparison with a "full sized" bug catcher. Would be interesting. Maybe someone on rec.radio.amateur.antenna has done some comparisons.

Thanks,
Joe K7JOE/KP4

754. ATAS up/down tuning

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-20 15:53:11 UTC
From: Walsh, Tom
Topic: 754 Message: 754

From what I can tell, not having dis-assembled it, it is
continuously variable (barring the mechanical limit of the
pickup bridging the winding, which could make a small discrete
change in the inductance?).

Subject: Re: [FT100] ATAS-100 optimization

From: Joe <k7joe@...>

Hi Tom, Thanks for clarificaton, but still I dont get
the mechanics of the antenna. Is this a stepper
motor? Or continuously variable?

anyway, comments follow:

> The sweet spots,
> as described here, are areas in which the tuning
> 'rate' is slow.

Right. Except that having a more "touchy" tuning
point means more margin of error in getting a
perfect match where the SWR is not exactly matched,
nor where the stepper motor (if used) is exactly
setting the tuning "shorting bar" at resonance. I
know a VSWR of 1.5:1 is a mere 4% reflected power, so
as I said, this may not be a notable difference, but
something to consider. Of course, base impedance also
effects antenna resonance, so, even with the standard
whip, on some mounting locations, the antenna may
resonate within the ham bands at a point other than
within the "sweet spot" tuning zone. Now I am left
wondering why Yaesu "optimized" the antenna. What was
the point?
> Addition of a longer
> whip increases the RX capture area. That's what I'm
> after. Using the
> ATAS, I'd say it's not a compromise at all, unless
> you compare it to a
> 3" diameter screwdriver with 102" or longer whip...
Agree.

I bet the bug catcher with 4 foot lower mast, 12 inch coil (3 inch diameter) and 5 foot upper whip would outperform the ATAS100 on 40M. Just a guess, though. Reasoning is the efficiency of the coil. I bet there's
a fair amount of loss in the ATAS100 coil -- the fact that the center of the ATAS100 is not air. How tall is the ATAS100? I seem to remember last year seeing it at Dayton last year, and it was about 7 feet long total.

I was just refering to the optimum antenna if spending 1400 bucks for a mobile HF rig. I (personally) use the best antenna I can afford (then again, I'm from the school that thinks multi-kilobuck rigs are worthless without good antenna) which happens to be the "get out and change the 'gator clip bug catcher" . What can I say -- it was cheap and it works well.

The ATAS seems to be tops in the league of hamsticks or outbacker or hustler antennas in terms of size and radiating efficiency (and hence field strenght performance, assuming both are tuned to resonance), but in the league of the large mobile antennas like full sized bug catchers and screw drivers, the ATAS100 probably wont play as well on 40M. Higher bands will likely show little if any difference. This is from an RF efficiency / radiation standpoint. Not saying anything about how an OM wants to operate (I dont mind getting out to change the 'gator clip in the rain, some do...)

Understanding that EVERYTHING is a compromise, the ATAS100 is fine for those wanting all-in-one antennas. I'd argue that it's the cleanest, simplest approach to all band mobile operation and probably earns points as an XYL pleaser. But, it IS a compromise and those wishing to get *maximum* RF *bang for the buck* should chose either bugcatcher or full size screwdriver. Same reason I dont run dual-band antennas for VHF-UHF. Yea, my truck looks like a porcupine, but system works!

Those who have run mobile believe the hamstick/hustler type antennas work fine on higher bands but fall off on 40M and stink on 80M. This has been my experience.

I would be interested to know the efficiency of the ATAS100 on 40M and a comparison with a "full sized" bug catcher. Would be interesting. Maybe someone on rec.radio.amateur.antenna has done some comparisons.

Thanks,
Joe K7JOE/KP4

Hello FT-100 owners !

First of all, i will thanks following peoples(John WOIKA, Allen YODDER, Cliff Bryant) for the helpful informations.

I also have some questions:

1.) Can i use the FT-100 for QRP (5 Watts or lower) ?

2.) What happens, when you change the values in the 2nd "secret" menue "F13 HF PO 10W" to a lower or higher setting ?

tnx

Mark & Net -
Any "NB" which operates in FM would have to be done at Audio Frequency which would explain the gripes people have had about the IC 706's noise blanker as being ineffective.
An Impulse Noise Blanker (normally called NB or Noise Blanker) can operate at the "IF" or Intermediate Frequency (usually somewhere near 10.7 megahertz. One reason it should be there is that the rest of the amplification and conversion stages will have that noise removed, and not be affected by it.
The NB reduces the response of the radio to an impulse. Such "impulses" come from things like ignition systems, motors, and other sources, entering the radio through the antenna.
These "impulses" are short term variations in the amplitude of of the signal within the radio. Elimination of all variation in the amplitude would yield a silent radio for AM, SSB, and CW. A NB will eliminate only the extremely short term variations and thus remove the "ignition hash" but not the "Highs" from an SSB signal, or the "dits" from a CW signal.
During FM reception, at or prior to the IF stage, the signal is converted to constant or fixed amplitude. The signal reception then continues by detecting changes in frequency (or phase) vs the nominal operating frequency. There isn't any information conveyed by the amplitude of the signal. A NB, operating at IF, would not do anything to the signal, it's a constant amplitude. It would thus be impossible for an IF NB circuit to operate on FM. An AF NB could conceivably affect the audio chain if there were noise getting into the amplifier chain after FM signal has been detected, by being radiated into the rig through the case, or conducted by the power leads, or some other abnormal path.
The FT-100 accomplishes this function through use of the "DNR" feature of the audio frequency DSP. Naturally the most effective method of eliminating the noise is to not let it get in the rig.
Your issue of ignition noise in an FM mode indicates that some signal is getting into the rig other than through the antenna.
Good luck eliminating the source, and use DNR to minimize the effect (on an FT-100).

Subject: [FT100] Re Noise blanker on FM

From: k1map@...

Hello Mark & Interested subscribers
Ignition noise is a common problem on 6 meter FM.
The noise I have a problem with is standard electronic ignition hash (ford v-8). No alt whine, at present, either on rx or tx.
The 706 has a NB that works (poorly) on 6m FM, but the NB on the FT100 will not turn on when the rig is on 6m FM.
Rigs like the (FM only) Kenwood 741/742 series have fairly decent built-in NB and commercial equipment (usually) has NB circuitry.
This was one of the features I was hoping for an inprovement on over the 706
Has anyone determined which adjustment is best for noise reduction on 6m FM on the Ft 100?

Thanks 73
Mark Casey K1MAP FN32sb

From: Cliff Bryant
Topic: 758 Message: 758

Well it's finally happened! HF and 50MHz have gone low power, like no power. 2m and 70cm are still fine but HF has ceased to function. I had just tuned the ATAS to 6m, great match, no problem. One moment full power was indicated, the next none! I've just checked it on a dummy load straight into the radio and no power is coming out so the external cables etc. are pretty much eliminated.
I'll do a final check tomorrow and then drop by the shop for the inevitable conversation. It'll be interesting to hear how it goes. I must confess that I have a feeling that the PA is not to blame because when the antenna is mismatched some power comes out on 6m. With the dummy load no power comes out. The SWR ICON is not showing at all for the record.

Oh dear, and I just heard a W1 maritime mobile station.

I'll keep you posted.

Cliff, G4PZK

Hi Cliff, Sorry to hear about the rig. I talked with Chip from Yaesu at Dayton and he told me that there was componet failure in the first rigs, in the driver, not the PA unit. He told me if it lasted 24hrs, than it would be fine. I guess this is not the case. Let us know what you learn. Mike..

Well, I guess it was my turn.... Had the FT-100 for three weeks now.

I was working a station on 6-meters FM and the Power Out went to ZERO (0). After some checking I found that I had
no power output on any HF frequency on any Mode. The transmit indicator comes on but no output, no SWR indicator
or anything.

I seem to have normal power out on VHF and UHF, all Modes.

I did notice when first checking the rig on the bench that the radio seemed to draw the maximum current when using 6-Meters. Around 22 amps as I remember. Other bands and frequencies were from 10 to 17 amps or so.

This is a neat little radio and I was falling for it. Hope this doesn't happen again.
I sent Yaesu an EM and asked for there expert advice but am most sure I will be packing it up and sending it off.

Will keep the group posted.

Lamar

761. Another Sorry Tale

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-21 00:34:12 UTC
From: Al
Topic: 761 Message: 761

I have been following the FT100 stories here on the list, and now I think it is time to add my own. Having read most all of them, there certainly seems to be a pattern here. I had my FT100 for three days. It performed perfectly, and I really thought I had escaped the fate that so many others have recounted here. Here is how the failure happened. I made several contacts on 15m from the car using the ATAS100. The rig was a pleasure to use. I switched to 6m. The antenna tuned perfectly and indicated full output with no visible reading on the swr 'bars'. I shut the rig off and went shopping for about 1/2 hour. I returned to the car, turned on the rig and heard someone calling cq on 6m. I tried to answer, but the rig showed no output. In fact it was very low < 1watt output. I had no output on any HF band, although vhf/uhf still operated with full output. I contacted the dealer I purchased the rig from, and they agreed to swap me out another brand new rig. I must comment that the dealer must be upset with Yaesu because they seem to have been through this before. They sent me another FT100. I powered it up. Without transmitting I noticed that the case began to feel warmer than the previous dud did even at full power out. Within a minute the receive audio began to fade, and it finally disappeared completely. I contacted the dealer, who must be commended for the great way they treat their customers, and they agreed to send me FT100 number 3. I have contacted Yaesu several times trying to get a straight answer to a simple question ...'What are the chances of getting a rig that will last a reasonable amount of time before needing major service' I have asked Yaesu if they are having a higher than usual failure rate with this new product, and was told that the failure rate was 1 to 2 percent. All I want Yaesu to do is tell me if I can get a working radio or not. They don't seem to have the answer. Im hoping number 3 will work out. That's my story, and I see by reading some of the others here that it will be a very familiar one to many of you.

762. ATAS-100 mount pics

I took some sub-quality pics with my cheesy Casio digital camera of my ATAS-100 mount job on my '99 Ford truck and posted them in a folder in the SHARED FILES area of the list for those that wanna peek. I should definitely take some 35mm pics and scan them for better quality pics later I guess. Maybe some other guys could post some ATAS-100 mount pics to this same folder to share ideas.

Scott
KD7EKO

PS; My pics are for display purposes only I guess, since I tig-welded a stainless bracket under my wiper cowl, and not everyone's gonna be willing to do that most likely (however it is a clean/discrete mount job). I'm interested in other guy's ideas on this antenna mounting, and a lot of other guys are probably interested in other ideas also.

snip-snip-sniipety-snip

(or, apropos to the subject: poke-poke)

I don't agree. NBFM is only immune to impulse noise IF it is strong enough to be driven into limiting. You can quite easily hear pop-pop impulse noise in a moderate strength FM signal. It is quite prevalent in low-VHF especially near 6m. That's why commercial gear like Motorola has noise blankers in it, the system is called "extender receiver". They have an auxilliary receiver placed near the main receiver, and when it detects impulse noise it pokes a quick hole in the IF.

That's my story, and I'm stickin' wit' it.

Wow! Live and Learn! Not clear on the physical and electrical
layout, but sounds interesting. Why don't they simply use AGC
to insure limitting? Would it cause oscillation or something?
Thanks for the info, but for ham rigs generally, I'll still stick
by my story (with the removal of "Any NB").

Why didn't you address the 'converted to a constant ...'? If
I understand your explanation, it sounds as if the limitting
operation is not possible or something in certain circumstances.

Well, let's see. If a signal is simly too weak, ACG/limiting couldn't take effect. If it gets strong enough, the limiting works, and amplitude noise is cut off by limiting. A bit of this has to do with bandwidith too, the narrower the worse.

I don't remember the "converted to constant" part, but if you accept the "limiting doesn't work under a certain strength" concept, then it should all fit.

Anyway, the second receiver off-channel would (maybe be AM? I forget) poke a quick hole in the IF response of the on-channel signal. You can't take this concept too hard, because you could cause a lot of distortion.

That's a new idea !! Compile a list of Serial numbers and problems (if any).
Maybe we can find a correlation.
Mine is 9D021762, bought 19 MAR '99
And it still works great !

Mine is 9D021727 and it has done everything I have asked of it, including
transmission on bands covered by the modification.

Well, if someone is trying to compile a list of serial numbers in a "problem(s)/no problem" study; the serial number of my unit is 9D021821

I would guesstimate I have at least 60 to 75 'trouble-free' hours on this radio mostly mobile and some portable - all using the ATAS-100 antenna (with the ATBK-100 radial kit when portable). Mobile country count is 13 (mostly 15 & 17m), numerous states (mostly 40m), and 9 grid squares working a 6m opening to the Southwest (from Chicagoland area). Just a dynamite radio / package and enjoying the heck out of it.

Hello everyone!
I recieved my FT100 a couple of days ago. It's my first radio, and I'm quite excited.
The manual could use a little work, or maybe it's just because I know very little about radios other than what I learned for my liscence. It mentions the icons and codes on the screen, and how informative they are but never sets out a list of what they are and what they mean. I thought I saw someone mention they had a jpg file of these? I checked the shared files area at onelist but could not find it. Could someone send that file to me, or upload it to the shared files area?
Many thanx, and 73's

From: Lamar Brown
Topic: 778 Message: 778

As noted yesterday, The HF output power of my FT-100 went belly up while talking to a station on 6 Meters.
(VHF/UHF Output power OK).
I seem to recall several other people saying that they lost there rigs while on 6.
I do recall that during my initial testing of the radio on the bench, the radio drew it's maximum current while on
6 meter FM. Around 22 Amps. Has anyone noted this? Is is this a pattern we are seeing?

Yaesu answered my e-mail in about one hour after I sent it. They expressed regret and suggested that I box
the radio up and send it to them. They indicated repair time was now about 2-weeks.

Oh Well, back to the old Icom VHF 2-meter mobile while we wait.....

Hi,

I recently purchased a FT-100 (Ser# 9E032253).
It lasted about two transmissions. It ran very hot and was drawing over 7 amps on receive only.

HRO (New Hamshire) was very good about replacing it. No Problem at all.

The new unit (Ser# 9D021634) has been running now for several days with no problems.

I really like the radio. Using it with the ATAS-100 antenna, great combination.

Hi,

The tuning of my ATAS-100 antenna doesn't seem to behave exactly the way the FT-100 manual says it is supposed to happen.

Two questions:

1) Manual says to press TUN once to turn-on antenna power and the TUN is supposed to be bold then. Then press and hold to tune to actually tune the antenna. Mine does not do anything to a momentary press of TUN but does tune the antenna if you press and hold for 1/2 second. Is this normal?

2) How do you get the antenna to retract for 2M or 440? Mine does not seem to work per the manual again?

Thanks & 73's

John....my ATAS100 does what yours does. When I change bands, I hold
the tune button down for a second and then release. The antenna then
moves until the swr icon shows zero and then the sound returns on
receive. I have a separate antenna for 2 mtrs and 440 Mhz, so I have
not done the VHF UHF bit, however, it tunes on 6 meters just fine.

Your tune works the wayt that mine does. You push the button until it beeps and then it tunes. Mine doed not retract any anytime on the 2 meter and 70 centimeter bands. I have checked the SWR with it in all positions, and it seems fine without having to retract. I did lift the rubber boot on mine and there are windings on the coil that are closer at some spots than others. I also had just finished a CW QSO on 40 meters and found that the coil was pretty warm as well.

Mike

The rig is a shade under four weeks old - but it is the second rig. The first rig was DOA and went back the next day.

My current rig has been sent for repair rather than replacement. They do not have any stock apparently. I'm not going to kick up a real fuss at this stage I'll go with it for a short while.
The shop were quite concerned when I reported the tales I'd heard on the reflector. Apparently a German station has been stating that the rig can be converted to the 4m (70MHz band - UK and a few other countries only. The FT847 works on 4m BTW). I wasn't sure if the shop were exploring if I'd opened the rig up and tweaked! In this case I haven't even had the thing to bits.

Anyway we will see the outcome. Oh the price in the shop had also dropped about $100 USD but there's not much I can do about that.

I'm interested to hear about some of the experiences with vendors attitudes to failure and repair.
In my case Yaesu UK are about 2 miles from the place I bought the radio. I pass both places everyday on the way to the office.

What is the turnaround time for a repair with these radios in the US?

My fingers are crossed for you Per.

Since you have a D serial number and I had an E serial number I guess that
the E does indicate a European model i.e. 1750Hz toneburst.

Obviously the 'it blew up' problems are not limited to D or E models.

No, I purchased mine from HRO Delaware as a USA model and its SN is
9E032102. I believe the first 9 refers to 1999 as year of manufacture,
and the letter represents the month of manufacture, or the production
run. Maybe someone else can shed light on this. Mine is still running
fine, but I use it very little on 2m or 440, and not at all on 6 meters.

About the only anomaly I see is sometimes the sensitivity is low on HF
when I first turn it on, but everything is OK if I turn it off and back
on again.

Hi Cliff,

Thanks, I wouldn't say that I'm nervous, I'm just expecting anything to happen. I'm really using my radio making a lot of Q's and tests into dummyloads on 6 M (no ant available yet) in order to 'provoke' any faults. It sounds like the 6 M is where the problems begin...!

So far it has got hot but not in the near of 'not-touchable'. My FT100 is still the only one in Denmark so if anything breaks down I will for sure not get a replacement.

790. Re: How do I?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-22 14:13:36 UTC
From: Lamar Brown
Topic: 781 Message: 790

Hi John,

I had a similar problem with my rig. I setup menu 61 for ATAS-2 as per the manual page 62. The antenna
would not retract when I changed bands to 2 meters or 70 Cm.

I checked the continuity of my duplexer and found that I did not have continuity between the antenna port and
the VHF/UHF port to the rig. The HF port had continuity.

Somewhere in the Manual it states that there must be dc continuity between the rig and the antenna to allow the
dc voltage to change the antenna setting. My duplexer allows this only on one port.

Rather than bye another duplexer I changed the setting of menu 61 to ATAS-1 which is use if you have two antennas.
I found under these settings that when I switched to VHF/UHF, the ATAS-100 would automatic retract to the VHF/UHF
position. When I went back to HF and Pushed the TUNE button it would work as normal.

Hope this helps in your case.
Lamar

No I'm not deserting to an FT847!

Someone asked a while ago if the FT847 had a hidden alignment menu. I have just found this on the web which may be of interest. I'll try it one my dad's radio later today.

Cliff

<snip>

I have just received the Technical Supplement (Service Manual) for the Yaesu FT-847. This radio has an Alignment Menu in addition to a User Menu. To enter this Alignment Menu, you turn off the transceiver, press the UP, DWN, and FAST keys on the microphone together, while turning the transceiver on again.
In the alignment procedure, each alignment parameter is selected by rotating the SUB-TUNE dial. The alignment is performed by pressing the MCK/W key while injecting a signal of the required frequency and level. Pressing the MENU key after a setting is made stores the entry. To exit the alignment routine, press POWER.
This radio seems to be very high tech in all. I have not entered the Alignment Menu, and do not suggest that anyone do so, without the proper test gear and electronic knowledge.

Hi Ray,

I wonder if this happens when you have the noise blanker on (NB)? On mine
if the sensitivity is low on turn-on I click the PTT switch and all
returns to normal.

Cliff,

I have also seen the menu that you talked about listed on the Internet.
I had a FT-874 before trading it in on
an FT-100. I wanted to go mobile and was not that interested in
Satellite operation.

It is a fine radio and the only complaint I had was not being able to
squelch HF noise that was above 1 or 2 S-units.
I wonder if you have seen this on your FT-847.

Lamar, KE4EG

Before mine died back in Feburary or whenever they first came out (a week after I bought it), it always ran hot even on low power settings on 2m. If your runs hot (rally hot) to the touch, it will die. If it runs cool, you are OK for now. Based on the reports, I have seen, it is simple as that.

No, it seems to make no difference whether the NB was on or off. Only a minor annoyance, assuming it does not represent the first stage of a more serious problem. Just worked VQ9CV with the FT100 (using it with a linear).

From: "Jack Kovar" <kovar@...>

With all the S Meter talk I thought I would offer a tool here.

Motorola Receiver Splitters! 50 ohm input and four 50 ohm output ports.
Little box about size of three cigarette packs.
UHF connectors common on Motorola radios

You can have up to four radios hooked to one antenna and compare their S meter and receiver
performance.
No messing with Coax switches.
They provide a constant 50 ohm match up to 1 GHz.

Let me know If any of you find these a needed tool, I will try to work something out with you.

Hi Lamar

I only get to play with my dad's 847 when I visit him - like today. I tried the menu thing and it worked just as documented. I didn't adjust any of the items!

No problem with the squelch. It seems to work pretty much anywhere. The problem we have is that the DSP seems particularly poor, at least compared with other radios (IC756, FT100! etc)

I think that the performance of the FT100 is similar to the 847 (No detailed measurements, just an overall feeling). The fact that the 847 doesn't have dual receive is a real pain. Even hf and 2m FM at the same time would do.

Mine is 9E031475 bought on 04/29

Still runnig fine with my ATAS - 100

Grounding the ATAS is a major must in my experience, I prefer to do the Tuning of the ATAS manually as usually I get there faster.
The SWR is seldom low in my setup, still some work on the bonding of car parts to do.

on the subject of serial numbers and Yaesu, here's how to decode them.
The source is the VX5 FAQ at http://technodaddy.com/vx5faq/faq.html#Q35

I apologize in advance if this is olde news, but I hadn't seen anything
like it posted here yet. 73 - j

"Q35: How can I tell when my radio was made? (top)

"The first digit in a Yaesu serial number indicates the year of manufacture.
The second digit, really a letter, indicates the month of manufacture. The
way to determine the month is to take the position of the letter in the
alphabet (C=3, D=4,....., N=14) and subtract 2 from that number. That says
that radios with an "L" are October radios (L=12, 12 - 2 = 10, October=10th
month), radios with an "M" are November, "N" is December, "C" is January,
etc. The next two digits indicate a manufacturing "run" number.

"For example, if a radio has a serial number of 9D04xxxx. Using the above
explanation, it is from the 4th production run and was built in February of
1999."

I'm curious - with all the memories in the ft100, banked in sets of 50 (or is it 25) how are others setting up their memory channels for day to day use? I have programmed in the basic local repeater frequencies, and am preparing to enter all the others that I'm interested in or may make use of, but would hate to duplicate ground someone has already covered in terms of coming up with a logical and useful arrangement.
Any tips would be greatly appreciated.

William (wmastop@...) (ve7wjm)

William,

I took the easy way out with this one. I do a lot of metal sculpting and was just going to make up a bracket, but then saw an off-the-shelf item which made it a little easier. I purchased a "BSA Kit" from Larsen Antennas. It's actually a kit which allows you to use a 2m or 440 mobile antenna, as a 'base' antenna. It includes a heavy-duty 'L' shaped bracket with a 2" long double female bulkhead connector (similar to a PL-258) permanently mounted in the short leg of the 'L' bracket. The long side of the 'L' bracket is about 10 inches long and allows plenty of metal for mounting to a balcony railing, window frame, etc.; using a couple of 'U' bolts or else 'C' clamps.

I used that setup from an Indianapolis hotel room a couple of weeks ago and made many contacts all over the country including a couple of Special Event stations. Great fun and very easy to duplicate.

Good luck and have fun,

Ron, K9ZE

The VHF/UHF PA, but, when that PA goes, its possible for it to shutdown the rest of the radio too. Basically, when the V/U PA goes out a possible side effect is that the Rx audio on HF will drop to near nothing and whenever you keydown on HF you will get a high swr icon and the radio disables transmit.

Woh boy. Mine is 9D021539 and I haven't had problems yet, but I have only
listened on it about 10 hours. I have heard if it doesn't get warm at all,
even in receive it should be fine. I wonder...

What's the warranty on these things, anyway? A year, or 90 days? Hmmm

817. S-meter readings on VHF & UHF

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-24 00:14:04 UTC
From: KA2YKC@xxx.xxx
Topic: 817 Message: 817

Good evening;

Just starting to play with the FT100 I picked up @ Dayton. Seems as though the S meter is "tight" on 2m and 70cm. A repeater a mile away only deflects the S-meter to S9+20db... I tried to reset the S meter F07 item under the hidden menus. Factory setting was 198, I set it to 240, and the S-meter is now comparable to my other dual band rigs. However, it is now quite "loose" on the HF bands..

Anyone else experience the same scenario ? Your F07 setting ? y

Serial # here is 9E031667 (or close to it, not in front of the rig at the moment).

73 Eric

Topic: 817 Message: 818

Hi Eric,

When I first received my FT-100, I ran some S-Meter tests using an
HP-Generator. I had noted the same problem
that you indicated. The S-Meter on VHF/UHF was much less responsive than
what I was used to.
Here is a part of what I found while testing my rig.

FREQ Mode S1 S9
146.52Mhz FM 3.0uv 90.0uv
446.0 Mhz FM 1.6uv 48.0uv

The Signal Generator also showed that the HF S-Meter readings were more
normal with what we expect from
time past. Generally 50 to 100uv for an S9 signal.

The above data is not to indicate that the radio is in any way lacking in
sensitivity. In fact it is very good on VHF/UHF.
I think what we are seeing is a radio that has it VHF/UHF S-meter set up
the same way that it's HF is set up.
I was used to seeing a bar-graph that would peg out with a VHF/UHF signal
of a few Microvolts. This is the way most of the single and dual band
radios are set up today. To have an S9 (90uv) signal on VHF/UHF you have
got to be VERY close to the other station.

The radio has very good sensitivity on VHF/UHF. We are just not going to
see much on the S-Meter..

73, Lamar

12 Months in the USA.

Mine originally exhibited the 'get very hot even without TXing' But, since the '1st' time it was fixed its never done that again. The last 2 times there has been absolutely 0 indication of an impending failure.

73,
Mike

823. AM Power Levels

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-24 05:26:03 UTC
From: David Riley
Topic: 823 Message: 823

I just purchased my FT100 at Dayton (S/N 9E032152) I haven't had any of the power or temperature problems mentioned on this list. However I noticed that in AM the rig puts out full power on all bands (100w-HF&6M//50-2M//20w-70cm) It is my understanding that in controlled carrier AM the transmitter should be running about 25%-40% of the power in SSB. I used the hidden menu settings to crank the power down to about 30 watts. Anyone else have the same setting on AM?

Also...when the rig is first turned on after a long period of being off, the audio is sometimes on the low side, and has a quality of sounding like you are listening through a long tube. The cabinet is also microphonic, turning up the audio will cause feedback. A very light rap on the top of the cabinet, cures the problem, and it will not come back even after hours of continuous use. It's something I am going to have to wait to happen full time before I can try to determine what I will do. In the meantime the unit is completely reliable, and I am very happy with it. I plan to give it a full workout during the VHF contest next month.

Jess,

If you change your menu setup for the ATAS 100 from ATAS-2 to
ATAS-1, it will fully retract on 2 meter and 440 with a 1/2 second
touch of the tune button. Operation on all other bands will be the
same as you're used to. Try it, you'll like it!

Your tune works the wayt that mine does. You push the button until it
beeps and then it tunes. Mine doed not retract any anytime on the 2
meter and 70 centimeter bands. I have checked the SWR with it in all
positions, and it seems fine without having to retract. I did lift the
rubber boot on mine and there are windings on the coil that are closer
at some spots than others. I also had just finished a CW QSO on 40
meters and found that the coil was pretty warm as well.

Topic: 825 Message: 825

I phoned my dealer today to check on progress and he told me that he has caused his own radio to fail by running full power on 6m, presumably FM.

Having returned the rig and its box I don't have the circuit diagram anymore but apparently there is a choke from the driver stage to the final stage that might be overheating. I can't confirm this yet.

I'll keep you posted.

From: bob-baldwin@xxxx.xxx
Topic: 827 Message: 827

I received my FT-100 in April, and the serial number is 9E031138. No problems to date- use it mainly on 75 mobile and some VHF/UHF. If the radio seems quiet after turning it on, just hit the PTT. As far as power settings go, each mode is individually adjustable, and I have AM set to fully deflect my SWR meter when set to full sensivity for antenna tune-up on 75 mobile, which gives a very low on-the-air carrier. The radio will easily receive 2 meter repeaters that I cannot reach with full 50 watts and a 1/4 wave antenna. Very sensitive! Also, seems to work well on AM aircraft. 73, and good luck to all with your 100's!

Eric:
One thing many people don't realize is that many of the radios out there don't actually report signal strength on FM. In fact, I think most are reading the level of limiting in the IF. The result is that you tend to get to maximum indication with only moderately strong signals. I too noticed that the S-Meter on the FT-100 is defferent from some of the other VHF/UHF radios I've used. It appears to be indicating signal strength and therefore, it would have to see an extreamly strong signal to get the meter to full scale.

833. ATas100 and ft100 Problems on UHF?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-24 18:49:45 UTC
From: Richard Greenall
Topic: 833 Message: 833

Hello all:

Okay, here is an interesting one.. This is going to take a moment to describe though..

I have the usual setup (just purchased a few weeks ago). I have a ft100, and an
ATAS 100 mounted on the trunk. Works fine on all HF bands, and matches fine on 2 Meters. My
440 performance was horrible, and I did some diagnosing.. The ft100 showed only a small amount of
SWR on the internal meter. (2 or 3 bars)..

We took an RF analyzer, and measured the loss of the diplexer at approximately 1DB at 449MHz.
We checked the entire cabling system back to the antenna. Total loss (with connectors) was about 1.5 DB at 449MHZ.

At this point, I figured this is just a terribly inefficent 440MHz antenna. I measured the SWR (expected to see a low SWR, as measured by the Ft100), and saw an SWR of 4.5:1 (measured at the antenna). Needless to say, I was rather astounded. Match on 2 meters is 1.2:1

I then extended and retracted the antenna to make sure it was fully retracted. Same SWR measurement. At this point, I am lost, and am going to be taking the antenna back to the shop. I am going to get them to try another antenna on it to see if the same problem occurs. I figure it must be some kind of problem in the antenna.

One other thing does concern me though. In a 4.5:1 SWR on UHF, the ft100 was still putting 17 WATTS power into the antenna, with no high SWR warning. (5 watts reflected power was measured). Why did this radio not back off the power? I would expect cooked finals at this power level in no time. Also, the SWR meter on the ft100 only showed 3 marks on the bar graph. Needless to say, I now have little faith in the built in SWR meter.

Anyone have any ideas?

They wouldn't even consider paying the shipping charges in the UK. Take it back to the shop at your own cost if the norm here. There are a (very) few exceptions.

Glad that the list got the result you need!

"People power, don't you just love it?"

Cliff :-)

Richard

Are you saying that even with a high VSWR the radio a) showed little VSWR on the meter and b) continued to put power out?

If the match seen by the transmitter really is as high as you say then again as you say the finals will cook. The mismatch will cause overheat, however I can't believe that the radio will run power into a 4.5:1 VSWR.

If as I suspect even though the VSWR at the antenna is 4.5:1 the match at the radio is within normal parameters then as you say the antenna is pretty appalling and the coax is trasnforming the match seen by the radio. The radio itself will be happy but it will just be putting power out as heat in the coax (not good).

Can you or did you check the match at the radio?

I have heard that the ATAS is not very good on 2m or 70cm hence I run a separate antenna, or I will do when the radio returns from being repaired!

I'd be interested to hear what happens with the new ATAS. If I get a chance I'll couple the network analyser to the antenna and look at the match.

From: Thomas M. Schaefer
Topic: 829 Message: 837

Just for the record,

When my radio broke and tech support asked for it, they offered to pay ground shipping. It was honestly the furthest thing from my mind to even ask. That and the 5 day turn-around, is the reason I decided to wait it out. And I am damn glad I did. I really like the radio (althought I do not use it on HF as much as I would like). I have to hook up my paddle because I would rather do CW mobile anyway. For some reason, I can hear the CW stations better in a crowd. That is if the bands ever come back up.

Richard,

I would like to see you try something!

If you could build a 1/4 wave antenna with a ground plane for 440 Mhz and start with it about 2 inches too long.
Insert a good SWR meter inline. Set the power output for about 5 watts and note the power out with each trimming of the antenna.
The internal SWR meter should be compared to the external SWR meter as you trim the antenna.
End you test with the antenna about 2 inches too short.--

The reason for this test is to determine error in radio and it's ability to determine inductive and capacitive SWR
relationships.
It may work just fine measuring a too short antenna but not a too long antenna.
When a antenna is designed and tuned correctly the Inductive reactance equals the Capacitive reactance.
They cancel out each other and a resistive 50 ohm match is left. A perfect VSWR.
It is possible the radio is not able to measure and adjust to some types of reactance's.
If you find testing to work fine with 1/4 then I suspect the you may have a radiation problem with the feedline
causing confusion back to the radio.
It must be able measure the correct Capacitive and Inductive reactance with it's phase compare circuit to make the correct decision on which way to tune the antenna.
A Smith Chart will help many of us understand this phase and reactance theory better.

sorry if this is clear as mud!
I do not have a FT-100 radio and just want to help others.

Topic: 833 Message: 839

A further refinement. Stop clipping bits off the antenna when SWR is low, use an antenna selection switch, and use the resulting antenna for 440.
Take a moment, sit back, and think about the proposition that the ATAS is a UHF antenna. There now, don't you feel better? Now, sell the diplexer to someone who doesn't know any better, and use the resulting money to buy a Larsen 2/70 dual band antenna or something like it. A magnetic (round) NMO mount version of that antenna will not come off a car unless it's a Lambo at full speed.

After you do this, you'll have a real UHF antenna. The local UHF/VHF SSB community here usually has at least one of these as a backup at the QTH (with the base adapter kit). I have two on the house, two on the P/U, and one on the other car. These are good antennas, and will serve better than using the ATAS. I use the ATAS for HF/6.

Cliff.

The swr was measured both at the antenna, and at the radio (pigtail plugged directly into the meter.). Both matched the same reading at 4.5:1.

I stopped at the Candy store this afternoon, but they didnt have another atas-100 in stock to compare with. When they get one in, they will hold it for me so I can compare.

Rich

Hi Rich

Well that is very interesting. If the radio is putting full power out into a 4.5:1 VSWR then you are most definitely right, the PA will get damned hot!

I look forward to the next installment.

Cliff

845. * FT100 / AM - 6khz Filter *

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-26 01:19:00 UTC
From: Geoffrey K. Hicks
Topic: 845 Message: 845

Just received my FT100... SN 9E031553... had a number of "green and orange dots" around the SN label (might indicate that it was factory re-checked?)... still awaiting receipt of ATAS-100 from vendor.

In the meantime, have it hooked up in the shack... receive only (small DC power source)... draws slightly over 1A on receive... fan kicks in once in a while... temperature normal. Still learning the controls... but have question regarding AM reception...

Will the installation of the kHz filter greatly improve AM reception? What "value" is in place without it? (aside from the ability to use the 2.kHz filter) I'd like to use for shortwave broadcast reception on occasion... ie. BBC London.

Thanks.

Geoff
KR4ZN

846. S-meter,Fans

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-26 02:17:13 UTC
From: emoxon@xxxxxxx.xxx
Topic: 846 Message: 846

Hello to all-

For the record, my SN is 9E031258. It has seen modest use on HF SSB, nothing has failed.

Has anyone else noticed anything peculiar about WFM broadcast? The bandpass seems extremely wide (+/-300kc) and the S-meter behavior was hard to understand. I checked the calibration @100MHz and found that S1 indicates at -80dBm, and 9+60 indicates at -66dBm (about 20 to 100uV, WFM only). That means signals jump really easily from way down to 60-over. I also get some unexpected quieting at some frequencies and even get a howl that depends on the AF gain setting - not sure what is feeding back. I just wonder if this is normal. Certainly WFM is not why I got the radio, and rx on HF CW/SSB and VHF FM is dandy.

AM seems pretty wide, too (no 6kHz filter). I hear SW broadcast getting into 10MHz WWV from tens of kHz away. Maybe this is what's expected without the filter.

By the way, what S-numbers do you associate with the bar-graph segments between 1 and 5?

Now about the fans. I notice that the box gets pretty warm just sitting in rx on 2m (consuming about 1.2Amps, normal). It turns out that when the box is warm like that, the fans will come on if the rx frequency is 70.500 or lower, and will go off if higher. This seemed funny, so I contacted Yaesu, and Mike responded:
>"The fans are controlled by the microprocessor. They will run 100% duty
>cycle in the HF bands, and only during TX and for 10 seconds following in
>VHF/UHF unless enough heat is generated to run them longer. The break
point
>for HF and V/UHF is 70.5 MHz. The operations you are describing are
normal."
What I see is that on HF and 6m, the fans will kick in (at low speed) when the box reaches some modest temperature, then turn off once the box is really cool. Above 70.5MHz it's different. Is anybody else getting the same thing? How about those 'overheat' F-settings (F48&F49)? I'm thinking I will just be conservative and make those fans run (slowly) all the time. Note that there's no problem with transmit, they come on full speed as expected.

As Yaesu starts doing updates/mods, it would be great to see what they are doing reported here. I think they've made a really neat radio.

73,
Ed, K1GGI

Dean...

You must hold down the MODE switch for at least a half second to toggle each
mode

AM or DIGITAL
FM or WFM
LSB or USB
CW or CWR (tuning the opposite sideband on receive)

I usually keep mine on AM, FM, USB, CW. Each amateur band can be set to
default to the mode you want to leave it in, and that is duplicated in each
VFO.

Hope this helps...

Topic: 845 Message: 852

I installed the 6-Khz Filter after having my FT-100 for one week.

Prior to the installation, I was unable to separate local broadcast station that were
20 Khz away. Had the same problem with Short Wave. Forget about trying to hear
AM stations on 75 meters.

The Filter was a worthwhile investment from my point of view (I like AM). Foreign
broadcast station still are audible on 10-Meters if using say a 40-meter dipole
but greatly reduced if using a 10-Meter beam.
PS Had loads of fun installing the filter.

73, KE4EG

Ed,

I have experienced exactly the same behavior regarding the fans. It kind of worried me seeing the fans running almost all the time on 6 meter and HF and only 10 secs on VHF/UHF.

I also contacted Yaesutech and got somewhat the same explenation. My ser. no. is 9D022066. My station came without the 1750 HZ tone burst and I'm waiting to get it fixed. Yaesu Netherlands are working on an updated CPU which among other things solves the tone burst. I'm eager to see what else they are changing with the CPU.

I've been vy active in a lot of local tests (Scandinavien Activity Tests) on VHF/UHF from my car (Yagi's - not ATAS100) with no problems at all. The rig was not overheated at any time.

Yesterday I went out to participate in the 6 M contest. Our portable tower crashed because of strong wind so the 6 el. beam looked a bit funny. Some repairment made it possible to get in the air anyway, however the SWR was 3:1. We were active for 4 hours running constantly full PWR (on my FT100 = 80-90 watts). The fans keept running at low speed (not disturbing) the whole time and the rig didn't get warmer than if I left the rig just receiving on VHF for ? hour.

I'm vy pleased with the fans and performance on 6 M (and VHF/UHF). So don't worry abt ur fans running constantly (almost) on 6 + HF and only 10 secs on VHF/UHF.

Regards
Per, OZ5ABO

855. Interfacing FT-100 with SGC Tuner

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-26 20:38:14 UTC
From: Chuck Scott
Topic: 855 Message: 855

Has anyone interfaced an FT-100 with an SCG 231 or similar tuner? Or, if not, does anyone have some detail on how the tuner control for the FT-100 works when the setup is set to "Tuner"?
As it stands now, I have the radio and tuner functioning, but it would be nice to be able to use the tune functions of the FT-100 rather than having to change modes to output a carrier at reduced power. It would also be nice to be able to use the radio to force the SGC to retune on a specific frequency if desired (which it appears I will need to do on occasions).
BTW, I'm pretty happy with the performance of this combination. I've tested it on 80-6 Meters and have been able to get it to tune on 160 (even thought the mobile whip is supposed to be too short for that). If I'm returning to a frequency that the SGC has tuned to before, it goes back to those settings in a fraction of a second, or in essence on my first sylable.

Chuck - N8DNX

856. Return

From: Cliff Bryant
Topic: 856 Message: 856

Got my FT-100 back today, not bad as I delivered it last Friday morning. For those that are interested hf/6m went (very) qrp (1W) According to the sheet they replaced R3059 and repaired the predriver. I'm not sure what 'repaired' means in this context but I understand that the circuit was modified.

Anyway my thanks to the shop and let's see how it goes.

I tested the radio out on 6m FM and a load of other bands and all seems ok at the moment.

Hi Mike

I'll try and put a meter in circuit. It's a little difficult as the radio is under the left, front passenger seat. I can probably intercept the fuse though. The mod they did was only to do with the driver, specifically the bias circuitry so it shouldn't really make any difference.

Two for the price of one!

I guess they would need to drive the amplifier harder at 50MHz to get the same output power. MOSFET capacitances come into play I would think.

6m is definitely the problem area I think. The FT847 is modifiable for the UK 4m band (70MHz) but the FT100 is (so far) definitely not. A lot of it is to do with the low pass filter network of course. You have the FCC specs over there but we have CE marking which requires very tight EMC specs to be met. I wonder if the EMC spec means that the emission standards just can't be met? Maybe the devices just aren't good for 70MHz.

Say hi to Deb for me!

Push down your mode button and 'hold' it for a couple of secs, you should then be able to see regular fm instead of wfm..

At 10:32 PM 5/25/99 -0500, you wrote:

>>>>

<excerpt> HI LIST

I have no 6 mtr FM on my ft 100

It lists in the mode menu : AM - UPPER SIDE - CW and
--------WFM which doesn`t key transmitter & shows the icon with OFF under it . No narrow band .

Other modes are fine .

Also it came with the Am mode on all bands set @ 100 ??

It runs cool on Rec & transmitt no heating problem SER #

My FT-100 hasn't died yet but it does take a 4 - 5 minute warmup before there
is any audio.
Also It acts as though there is no 160 meter bandpass filter as I have a local
1 KW AM station on 1490 mixing
with a distant station on 1050 producing a signal on 1850.

Other than that it works fine.

It will be going back for a vist with Yaesu.

Considering that the FT100 displays a percentage of max power out in the user menu, are you measuring the output power, or are you interpreting that 100 means watts, when it really means percent?
I'm also interested in accessing a "hidden" or service menu. How? I've been watching the little icons a little closer and find the swr meter to be helpful, but wish the ops manual had much more definition.
Lastly, and I'm going way out on limb here, but is there an open "FT100" net or would anyone like to make a sked to discuss the radio on the air? (I want a desk mike!) Jim KB8UNU

Hi Demetre.

It depends what you want. I bought the FT100 to replace my IC706 Mk1 because it supports the ATAS directly. It is also a full featured radio.

The IC706 Mk1 has been a good friend although in the early days it also blew its output transistors. The MkIIG is a more mature version of course with the 70cms section being added as a final update.

The FT100 was is very easy to use mobile, is small, is backed by a two year warranty and supports the ATAS. It also has the best noise blanker I've ever used in a mobile.

The IC706MkIIG is also an attractive radio.

Assuming my FT100 continues to work I like it just fine.

You should know that I'm not an ICOM fanatic, my main station is an IC-756 and I really like it. My VHF/UHF gear is Trio/Kenwood.

I've always considered ICOM to make the best main station equipment with Yaesu making the best mobile equipment. Note that 'best' is not always the ultimate rf performance in this context.

My Trio/Kenwood VHF/UHF radios are rather outdated but they do have decent front ends unlike most of todays DC to light gear.

Don't let the comments put you off or for either radio, if you can go to the dealer and try both.

Hi Jim,

40 might work during the day. We are rather close though.
I'm going to be around all weekend also. let's try noon tomorrow
at 7.265 +-QRM. I'll send u an email just before then to let you
know I am here. There is always a chance some company might drop in
unannounced. HI HI
CUL, Dave K8AA

Demetre,
My limited experience tells me that you are going to enjoy the FT-100 a lot !!
Have probably 75+ hours mobile and 10-15 hours portable, all using the
ATAS-100 antenna. I've logged 18 countries, 4 Special Event stations, and
numerous stateside QSOs using this setup from the car. Also worked out
almost 700 Km on 6 meters/mobile with an Es opening last weekend.

No complaints, zero problems, and more fun on the HF bands than I have had in
ages.
Good luck with all,
Ron, K9ZE

Demetre, Your right you haven't listened to long. I've had my ft-100 since April 6th and have had no problems what so ever with the radio. I'm a mail carrier and run the radio everyday for 7 1/2 hrs using all the bands (HF,6m,2m,and 440) in my mail car. If the radio died tomorrow I would send it back to Yaesu and wait eagerly for it to come back. For this is a great little radio and I'm going to buy another one this fall. Yes, they have had there problems, but they will be ironed out and I think if you ask most here that has had a chance to run one for any length of time(that is working properly) they will agree.. 73s Mike KF8MY....

If you have not heard a good comment, you must not be reading the email. I would suggest reading through the archives. You will find all the good info you need to buy this radio.

From: Paul R. Valko
Topic: 881 Message: 881

I hate to report this because I really like the FT-100, but my "9E0" serial number has croaked like many of the other early s/n's.

As reported here, a week before Dayton, the UHF TX became intermittant. On the way to Dayton, the 2M side quit transmitting after a hour of combined TX/RX.

Typical error was the "SWR" alarm would come on and power would fold back to almost 0 watts out. Even on a dummy load. The antenna checks fine with my analyser.

Yesterday, the SWR alarm came on all bands (antenna and feed still tested fine) also, the BIG BLACK "X" error came on, often! What's up with THAT?!?

Today, I noticed on 2M, no S meter readings.

And now, no audio output except when the rig is in FM or WFM. The "RCV" LED above the tuning knob still works and follows the squelch settings. I even did a complete reboot of the rig - no effect.

So off to CA it goes on Tuesday. Hope they treat it well, the FT-100 is an great concept. I really loved it while it lasted.

This may help. Below is the email I sent Yaesu and their response.

John KE1CQ

John,
Thanks for the email. The manual contains some conflicting information about the settings of menu #61. When using a duplexer, menu 61 should be set to ATAS-2. It is important that your duplexer have a DC path through both ports to allow the antenna control voltage to pass (It sounds like you've got a duplexer that does), and remember that there is a 60 second calibration period whenever the menu is switched. You will not damage the radio or antenna of the menu is set incorrectly.
Also - the ATAS-100 is properly set up for V/UHF operations when fully retracted.
I hops this helps. Please let me know if you have any further questions.
Best Regards, Mike Krueger - N6MIK, Yaesu Technical Support

At 5/27/99 02:17, you wrote:

Hi,

I have a FT-100 and the ATAS antenna system. It all works fine and I love the complete system for mobile operations.

I am using a Diamond MX-62M duplexor with the radio and antenna. Everything was just purchased at HRO.

When I set the FT-100 to "ATAS-2" setting as suggested by the manual, then the antenna will not retract on 2M or 440. If I set it to "ATAS-1" mode when you press the "TUN" button for 1/2 second then the antenna will retract but sort of locks in "TUN" mode for 30-60 seconds after the antenna is fully retracted. Also in either case the "TUN" mode does not work as stated in the manual, the "TUN" button does not turn bold with a brief push. A brief push does not seem to cause anything to happen. You must push "TUN" for 1/2 second, then it turns bold and the antenna tunes. When complete with tuning the "TUN" returns to normal and the SWR OK symbol shows up for a few seconds.

Questions:

1) Which is the correct setting ATAS-1 or ATAS-2?
2) Will I cause any harm using ATAS-1 with the duplexor?
3) Is the manual just printed incorrectly?

Thanks in advance for your answers and a GREAT radio.

73's John KE1CQ

Silly question

Have you connected up a duplexer to link both antenna outputs the the antenna and have you set up the ATAS select menu to ATAS-2?

Haven't heard any good comments lately?

This is a simple rule of commerce. If you make a customer happy he may keep it to himself or at most tell one or two people about it. If you make one mad he will curse you from one end of eternity to another and not fail to mention his discontent to any one who passes by.

I bought an ft100 in early april. S/N 9E031664. I am just nuts about this radio. It's hard to believe that such a small radio can do all the things this rig does. Some things it does as well as a full sized rig. Others are a bit of a compromise. Hey you want great AM, well hope you got lots of room in you car for the
Collins S' Line...

Don't pick me apart here either. I am very happy with my Ft100 and would tell anyone considering the purchase of a mostly mobile HF/VHF rig to carefully look at the FT100 before buying anything else.

Hello Demetre!

Saturday May 29 1999 21:19, Demetre Koumanakos wrote to <FT100@onelist.com>:

DK> I joined this list prior to me buying a FT100...
DK> To be host I haven't yet heard a good comment about the radio.
DK> Is this radio worth buying ? or should I look at the Icom MKIIG
DK> instead ?

I've had mine for about 2 weeks now, and have been quite happy with it. There's a very slight learning curve, but even with being entirely unfamiliar with radios, I was able to be broadcasting within 15 or 20 minutes of getting it all hooked up. The reports of signal have consistently been very good. The DSP noise reduction is very nice, though I'm still doing a little fine tuning with it. I have a ford car, so I need all the help I can get- grin.

DK> Come on Yaesu fanatics, support your radio...

I'm not a yeasu fanatic- in fact, this is my first radio of any kind, but as noted, I'm happy thus far with it.

Tom

What is this supposed to mean?

Because certain people report that their radios have had problems (including mine!) that we are somehow judged to be responsible for the demise of our sets?

So when my radio was DELIVERED to me DOA I am responsible even before I got it out of the box? Maybe I plugged the 13.8V supply into one of the RF connectors? I think not.

Secondly when my radio's HF PA ceased to operate I was reponsible for the alterations that were carried out to the predriver bias circuit? Maybe I shouldn't transmit 100W on 6m anyway?

I know that a lot of people here that have had problems have been very patient waiting for a repair. Yaesu or my dealer did the right thing by me both times.

Maybe you are implying that we go on about it (like now!) Well if nobody reported their experiences they'd be no point having a list like this.

Please don't make assumptions about people's ability based upon what they report.

Maybe you've had your radio for four weeks and it works perfectly because you've only ever used it for listening to broadcast bands? Maybe you haven't found the on/off switch yet? How do I know?

Possible quirk...

We has some rain last night, about 5 inches worth in one evening. I have noted the comment in the manual about not running the ATAS100 through a car wash. Anyhow, after the rain the antenna refused to tune gave me an ANTENNA ERROR whenever I tried to tune it. I checked all connections and all were good but the radio still refuesed to tune. I went into radio setup menu and toggled between ATAS-1 ATAS-2 the tunner position and none. After I did this the radio suddenly said it was tunning the antenna. This went on for a about 1 minute and then all functions are normal again. Tunes on all bands.

Does anyone else use the ft100 to listen to tv audio? What success have you had? What antenna are you using?
I can get channels 4/5/8 ok 11/13 are spotty, 21 and higher are kinda piss poor. I have excellent reception on aircraft and 2 meters/440 mhz..

De Wayne-N0ISV

I recieved my FT-100 on 3-23-99, and the serial # is 9D021658 !
I have had the following problems:
1-Fan noise during first 2-3 key ups,(then goes away)!
2-Excessive heat on high power (FM) out the mobile mount and screws, (seems to be more heat on the right side)?
3-Power out put on 6m FM is not to printed specs! 100% = 85 watts
50%
= 40 watts
25%
= 20 watts
This was with a meter and into a dummy load! Although it can be adjusted to the printed specs, in the sub menu, I will wait and see if Yaesu has anything to say about high power on 6m FM causing problems?
4-The AM high power out put is at 100 watts on all bands! I don't think this should be this high? This can also be adjusted down in the sub menu!
5-Some times, I'll get a swr reading that jumps around, high,low,high,low etc! This may be operator error? (hi)

Other than that, have made alot of contacts vhf/uhf FM and SSB.
6m local and E openings on FM and a few ssb.And alot of HF!
Some 29.600 openings.
Good 40m contacts.
And alot of 80m contacts.
All of the above contacts have been with real good signal reports.
Running a Screwdriver for HF mobile, Ham Stick for 6m, M2- 2m and 70cm Q loops for ssb!

After running the FT-847, the FT-100 takes some time to get used to!
Also, the FT-847 has not any where near the troubles the FT-100 has had for some hams!
I sold the IC-706 for the FT-100, and would not go back at this time!

I think Yaesu was blowing SMOKE for to long on the FT-100 and got caught with there pants down. One more trip to the ladies room is needed!
Good thing for there 1 year Warranty, most of us will need it!!!!!
So far, so good on my FT-100!

73-Wayne-N0ISV

892. FT100 vs. MKIIG

Yahoo group: FT100 (1998 — 2000)

Topic: 892 Message: 892

Demetre -

I purchased two (2) 100's during their first production run, and both failed.
I got real PO'd and got my money back, ran out and purchased the ICOM.
Of course the ICOM works fine, no complaints at all. But consider this:
Yaesu has a track record of producing the most innovative and almost
daring designs. I really love that method, and I own many Yaesu's of
one type or another.
The FT100 was just way to premature, yet way too late to market at
the same time. Yaesu has got some internal problems which I really
don't care about, other than they affect me directly on such issues.
My *opinion* is that the FT100 will smooth out over the next year or
so, but I sure as hell am not going to let Yaesu let me be their
Gunea Pig - especially when I have to pay for that "priviledge" out
of my own pocket.
A good majority of FT100 owners have had to send their unit to the
factory for one reason or another, sometimes multiple times.
So I'll wait, when they get this little rig all straightened out, it'll be
the hottest thing around. It has a superior design, and features just
not found on the ICOM.
But the ICOM works.
I've also noticed that some of the Yaseu die-hards out here on this
forum get real fluffy when you say *anything* negative about the rig,
in any form. It's sort of like the people who voted for Clinton -
knowing full well they made a horrible mistake, they are not about
to fess up to it - or tolerate any ridicule till he's gone...(lol)

Comet 530 Duplexor in line with the ant. It tunes fine on 6/and
hf but it will not tune on 2/440 the menu is set to atas 2 I
try atas 1 but it does not nest on 2/or440 swr very high. Is
there any test I can try to see if the ant is bad or the
radio.

Demetre:
All depends on who you talk to. I have both the FT-100, which is working fine now after being returned due to problems with VHF/UHF output, and 706MKII, that went totally belly up a few weeks after I got it. Now that they are both repaired and appear to be reliable, comparing the two has left the 706 in my basement and the FT-100 mounted in my truck. There's no question in my mind that the FT-100 is the easier radio to use and is an overal better performer, particularly regarding the noise blanker and DSP. OTOH, the 706 is a difficult radio to operate mobile, particularly if you need to use it also for repeaters while traveling and the lack of a functioning noise blanker makes it effectively useless on the highway when driving anywhere near a gas engine (mine's a diesel). At this point, ICOM's got some catching up to do!

Topic: 892 Message: 896

Dear Mr. Anonymous, You state, "A good majority of FT-100 owners have had to send their unit to the factory for one reason or another,... "
When joining this list some time ago, I read through the complete archive and have received all postings since that time. I have also read in a posting Yaesu's repair rate on this rig. My impression is that a small portion of the total FT-100's sold have gone back, despite the attention given to those early problems. Despite your comment "Of course the ICOM works fine, no complaints at all.", I have seen a number of problems/complaints on the Icom (especially the IC-775 as of late) and Kenwood lists regarding their respective models.
Never mind about those who (in your words) "get real fluffy"; for the sake of truth, have you got any real statistics or proof of your "majority" comment above?
If you have, please post them to enlighten us all on these statistics (please, no second hand info like 'my dealer said" this or that, what I'm looking for are facts);
if not, then I am curious to what your motives were for your posting.
BTW over the years (over 30 yrs in Ham Radio) I have been primarily an Icom user and the last three rigs were a IC-756, FT-100 and currently the IC-746. The FT-100 was an excellent rig, with no problems. The 746 has been a pleasure to operate also.

Demetre -

I purchased two (2) 100's during their first production run, and both failed.
I got real PO'd and got my money back, ran out and purchased the ICOM.
Of course the ICOM works fine, no complaints at all. But consider this: Yaesu has a track record of producing the most innovative and almost daring designs. I really love that method, and I own many Yaesu's of one type or another.
The FT100 was just way to premature, yet way too late to market at the same time. Yaesu has got some internal problems which I really don't care about, other than they affect me directly on such issues.
My *opinion* is that the FT100 will smooth out over the next year or so, but I sure as hell am not going to let Yaesu let me be their Gunea Pig - especially when I have to pay for that "priviledge" out of my own pocket.
A good majority of FT100 owners have had to send their unit to the

factory for one reason or another, sometimes multiple times.
So I'll wait, when they get this little rig all straightened out, it'll be the hottest thing around. It has a superior design, and features just not found on the ICOM.
But the ICOM works.
I've also noticed that some of the Yaseu die-hards out here on this forum get real fluffy when you say *anything* negative about the rig, in any form. It's sort of like the people who voted for Clinton - knowing full well they made a horrible mistake, they are not about to fess up to it - or tolerate any ridicule till he's gone...(lol)

I commented on serial # some time back on the list. It would be nice if the list would have done a survey on radios working or not, instead of whether they owned one. I have been trying to keep track here some what for my own purposes. It would be nice for comments like (most of the radios had to be sent back). This is wrong, so far as the list goes. From what I've seen of the people listing there serial numbers and stating whether it was working or not, the return rate is about 4%. I don't think that's to bad. Remember, this is my own observation and if you were to go back through the archives you could problably back this up. There were people that gave there serial number but did not say whether they had any problems with the rig. These could not be counted one way or another and I could have missed some. But just for my own benefit I am very happy with the rig and see that anytime someone asks a question about something, or seem to have a problem getting used to the rig (because there is a learning curve) its gets looked at as another bad rig. I wonder how many people stated problems and later found it was operator error but did not come back and state that. That's ok cause that's what the list is for. Learning about the radio. It prevents others from doing the same thing. Lets keep it up. This rig is not for everyone, I'm just glad its for what I want to do with a radio!!!

73s have fun,
Mike,KF8MY

898. Re: ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-05-31 13:33:54 UTC
From: Lamar Brown
Topic: 555 Message: 898

Hi Dave,

I am using a CF-530 duplexer also. The FT100 can not send a signal through the VHF/UHF port to tune the ATAS-100 because there is no DC continuity on this port.

My setup will however work if the FT100 is placed in the ATAS-1 position in the menu.
EXAMPLE: If I am on say 40 Meters and switch to 2-Meters the FT100 sends a default retract signal to the ATAS-100.
This default retract signal can last up to one minute or so. The antenna has long sense retracted. I found that after about 10 seconds or so I can tap the Tune button and the sequence is terminated. I can then use 2M/70Cm.
I have noted that if I was say on 6-Meters or some antenna position close to the retracted position that sometimes the antenna did not retract. However, this is not always the case. It did retract always if on the lower bands.
Maybe this will help in your trouble shooting.

Lamar, KE4EG

Why bother doing the survey you describe when only 55 people out of over 250
responded to the original survey question.
If we go by the results of the first survey about 75% on the list own a
FT100.
I don't think that this is an accurate number.
So we will try again with your question. Just for kicks.

Hello,

There is a new survey for the FT100 community.

My Ft100 (fill in the blank please ALL OF YOU) ?

Possible answers are:

o Never Broken.
o Broken more than once.
o Been exchanged for an ICOM
o What FT100 ? I dont own one yet.
o Works FB.
o Will never break
o Has broken several times but now it works FB.
o Has broken once and now works FB

To vote, please visit the following web page:

http://www.onelist.com/surveycenter/FT100

Thanks!

You forgot.

Broken and replaced. Then new one broken and replaced or new one broken and repaired :-)

My first one was DOA - and replaced, my second one was broken and repaired.

If I have two radios do I respond twice? If so does a replacement radio count as a new one?

Sorry to make life difficult.

Cliff

Forgive me folks for taking up bandwidth to answer "No Sig's" reply. I will be brief.
No Sig, if you call "asking" for facts to back up a statement, a "position", then I'm proud to take that position. Knowingly or not, you did answer my question:
You apparently don't have any facts to back up your remark.
No big deal to me, I just wanted to know if there was any truth to it. I have made remarks I later had second thoughts about, so I'm not placing myself as "better" than you in that respect [more mature, yes 8^)].
I will leave it to the readers of my original post and your posts, to judge who is hysterical, emotional and clumsy in logic.
Again, my apologies to the 100 group and no further discussion from me, it really doesn't belong here.

Hi Demetre,

I am no Yaesu fanatic as this is the first HF Yaesu I have ever owned. I also own Kenwood HF gear. But I have not had any problems yet with my rig. I only use it mobile and just got back from a 4 day camping trip in which it worked just great.

I waited about a month to order my rig after they came out so I did not get a real early production radio. So the newer ones may have been checked for some of the bugs the first radios had.

911. FT100 RX Performance 470-520 MHz

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-01 23:31:10 UTC
From: Stephen Lui
Topic: 911 Message: 911

I've been looking at the FT-100 every since it was announced last year. I wanted to know what the RX performance is on 470-520 MHz. Many public safety agencies (LAPD, LASO, our local PD) are on T-Band UHF, and I wanted to listen to them on a FT-100. I have read most of the archives for this mailing list, and I read one message saying the FT-100 doesn't do to well between 500 and 800 MHz.

912. Antenna Options for FT-100 (CA-UHV, etc...)

Yahoo group: FT100 (1998 — 2000)

Topic: 912 Message: 912

I have a '99 Chevy Tahoe and am exploring HF/VHF/UHF antenna options for a possible FT-100 installation. The truck is only a few months old and I really don't want to start drilling holes. What are the mounting options using the antenna hitch?

Is anyone using the Coment/Diamond multi-band antennas (CA-UHV, MV3A, HA4S w/ a dual-band antenna)? I have some height restrictions since I park in a underground garage (6'6") and leaving the vehicle to fold down an antenna is somewhat hazardous considering the traffic. Will the ATAS-100 work well mounted on an antenna hitch?

Steven....I have the ATAS100 mounted to a 1/4 inch thick by 3 inch wide
strap iron that curves around my plastic bumper on the Linclon Mark
VIII. This strap is bolted to the tow hook under the bumper. I do not
have any other grounding and it works very well on 40 through 6 meters.
I use a dual band mag mount for 2 mtrs and 440....Dale KC2PZ

I was recently at a hamfest and saw a 4 runner with the ATAS 100. He has it mounted to the side of the truck at the taillight. All the screws were covered by the tail light lens. The setup looked very professional. The only drawback to this is you have to be good working with metal, or know someone who is.

I bought the new Comet CA-UHV antenna at Dayton for use with the FT-100.

The antenna works fine, it replaced a CA-HV, unfortunately, the UHF "trap"
came apart after only two weeks! It really looks like a design flaw to my
unqualified eye. I wrote Comet last week but do not have a response from
them yet. I would hold off on the CA-UHV until this possible problem is
addressed by Comet. I will keep the list updated with what Comet does.

By the way... I finally sent my 9E0 serial number in when the receiver
went dead this past weekend. Only worked on FM and WFM.

I have been using the Comet HA4S for HF, A Diamond NR770HNMO for 2m/440, And a Comet HA050 for 6. All work well with the FT100, which has also been working well. There is a quirk with the FT100. If you are using one of the Duplex memory channels, and change to a non duplex channel, the radio stays in "Split" mode. I manually turn off the split. Anyone else find this also?

Hi Stephen,

I've been running the FT-100 with a Comet CA-UHV for about a month now, mobile. I have a Comet gutter mount with about a two inch knob on it's side for loosening and folding it over. Presently I'm using that one only on HF-6m. I also have a Comet SB5 ??? 2m/70cm, also on a fold over mount. Both must fold flat each day for clearance in a parking ramp, and I can loosen both from inside and fold them before entering the ramp. BTW both are mounted on a Jeep Cherokee Sport. My only complaint about the CA-UHV is that on mine, the UHF choke tube was loose, but I used shrink tubing on it to hold it in place. Also would be nice to have an 80m coil for it, and may have to build one myself.

Keep reading about the hidden menu.
How do you get there and what is in it?

No problems with the 100 serial # 9D021824.
(have completed MARS mod. (AFA2XQ))

Thanks for all your help members !!

Deb,

These surveys are not very useful. Usually, you are forced to respond to a predetermined "answer." I looked at the survey last night and none of the responses fit my experience with the rig, and if I remember right, two of the answers were basially the same.

I sent my 100 back to Cerritos yesterday with a dead receive, no UHF output and a couple other oddities.

I have every confidence that it will be fixed. It really is a great rig and I don't thing ANYONE on the list here has a "new" build of the rig that has failed.

Am I correct?

Paul, I understand what your saying with the survey. But if you sent it back for repair than IT IS NOT WORKING, am I correct? That is in the survey and I think when it comes back and if it works correct you can go in and change your vote. The tech men at Yeasu told me they corrected the problem after the first run(1000 rigs). I can't back this up, he may have been passafiing me. But that is what he told me. I think some of the rigs that are going back are second production as showed in the ser#.
Also the survey is a better look at what is happening than one person stating that mostly all the rigs are going back for repair. How accurate is that? At lease you can look at the survey and get an ideal. Thats why everyone has to try to answer it.
I'm sorry to here about your rig, I'm with you, I'm sure they will fix it and you will be enjoying your rig once again. 73s Mike, KF8MY

924. Antenna, PSK31, Secret Menus...etc. etc

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-03 02:50:21 UTC
From: David O. Ausley
Topic: 924 Message: 924

Hello Everybody!
I've been reading the list for several weeks now and finally figured it was time to submit something, even if it is mostly questions. The list has been enlightning and entertaining so far and I appreciate everyone's input.
My 100 was purchased from RT Systems at Dayton a couple of weeks ago(9E0 series s/n) and it has been a blast operating it for the last few days! (Luckily I had a week off from work to play with it last week while camping in the mountain lakes region of North Alabama.) The learning curve of this rig is not to steep, but it has taken quite a bit of repetition for me to get comfortable moving through all the menus and memories. From my campsite dipole I worked several locals on 75 and 40 m , also had fun with a brief 10 meter European opening catching some German stations and a nice ragchew with an EA4 in Madrid.
The antenna discussion has been helpful for those of us still considering a good mobile HF antenna. (Presently running Hustlers for 75 (pitiful!) through 10. They seem to work just fine 20 -10 meters) At this point I am leaning toward the High Serria screwdriver which really impressed me at Dayton. Although not as sexy and automated as the ATAS, it does cover 75 and can be used with my old reliable TS-440. Haven't really decided yet, and probably will continue to read the posts for a few more weeks before dropping the $300 either way. Anyway, here are some questions I don't think have been discussed very much if at all:

1. Is there a simpler HF antenna tuning procedure (non-ATAS) than switching to low power AM and keying the mic while fumbling with the tuner knobs? (The little third- party tuning plug for the 706 is a really neat idea if it could be applied to the 100.)

2. Has anyone interfaced the data port to a TNC or used the FT-100 on PSK31? If so, what are some of your experiences and sample circuits?

3. Somewhere in these posts I have seen mentioned "Secret Menus." Are there other hidden menus not listed in the manual and if so could someone please re-post that info?

4. Has anyone seen any programs or experimented with interfacing a PC with the "CAT" port for computer control? I asked the RT Systems folks (They write the ADMS software for Yaesu) if they had any plans for something for the 100 and they gave me an elusive "Possibly in the future" answer..so who knows. Sure would be nice to at least have something to manage all of those memories!

Well, I guess that gets all that off my chest! Keep up the great list and I will try to be a little better at posting more often myself.

73's and we'll be listening on 7.210mhz between 5:45am and 6:30am cdst while spending quality FT-100 time on my morning commute to work..... CQ CQ FT-100s!!

Rx performance FT100 vs IC706mkII(g)?
Please describe your experience, A-B comparisons, etc. First hand experience only.
I am interested in performance, i.e., adjacent frequency rejection, selectivity, sensitivity etc.
On HF as well as 6 and 2 (and 440).
Certainly this comparison has been made many times over by now!
tnx
Jeff

Hi David, I run a homebrew screwdriver antenna with a 600w amp mobile and I use the am mode to tune from the mic buttons. With a screwdriver antenna theres no other tuning than the switch to move the antenna up and down. Its very simple,Punch the programed button on the mic to put in am key the mic,tune and punch the mem button on the mic again when done to get back to your freq. and the mode that you were in when you started(thats a memory channel for me). Its not bad, with the 706 you have to go to the rig to punch the buttons because theres no buttons on the mic. I've been mobiling for 15 yrs and the buttons on the mic are very important to me.
73s, have fun, MIke KF8MY

Jeff:
I have both and asside from needing the AM receive filter, they both are good performers...except! The weak link in the 706 is it's noise blanker, and that's a problem for mobile operation. I drive a diesel, so there's no ignition noise from my vehicle. However, unless I'm out on the seasonal roads, there's nearly always other traffic and noise sources. Due to the poor performance of the 706's noise blanker, it was rare that I was actually seeing the best receive performance the radio could do. I suppose it's possible that my 706 is less than optimal, but I've talked to other 706 owners who have the same complaint. In contrast, the FT-100's noise blanker and DSP noise reduction and filtering work pretty good, and that alone makes the difference between the two radios.
The other glaring difference is in operation of the radio. I find the FT-100 menu system much easier to use and unless you get the aftermarket mod for auto repeater shift on the 706, it's a real pain for repeater operation.
Needless to say, the radio that's currently in my truck is the FT-100.

Thanks for keeping that list. I will let you know what happens to mine.
I do not have the SN at hand, as everyone knows, it is in the shop.

My serial number is 9D021544. It was returned once and repaired. Working fine now.
Problem was lost receive on SSB, CW, and AM.

I put my bencher paddle in the truck so I can operate mobile CW, but I noticed some strange behaviour.
Does anyone else notice something strange with the keyer. I have the speed really high and sometimes it seems to lose dits. Has anyone played with the QSK timings, etc.

I sent a message to the list when I got the rig back. Below is a copy of the message....

I reported back in April my FT-100 died. It would not receive on SSB,CW, or AM. Yaesu
got it April 28. It was back in my hands on May 11. I installed it back in my car and have
been happily using it since. The paperwork that came back with the radio says they
replaced defective parts on the PA unit (IC IR3M03N2 and chip cap, RMC1/4), installed all applicable updates, and tested all function and aligned unit to specs.
Even with the problem I had I am very satisfied with the radio. I use it mainly mobile with
the ATAS antenna. I like 10 meters and have worked South America, Europe and Australia.
In all cases the stations came back to me on the first call.

Take a look at the circuit diagram of my mobile boom mic adapter on my web site

www.thebryantfamily.com/_borders/FT100mic.jpg

...all will become clear. I do have the details for the other switches but I didn't need to use them.
I've been using this circuit with a yaesu boom mic since I got the radio. As my radio is the European model we don't get the DTMF microphone but the basic principle is the same.

950. List of Serial #'s

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-04 20:25:19 UTC
From: Jarrod Smith
Topic: 923 Message: 950

This is the list that I have compiled from what everyone has sent to the list about their FT100. Unless noted the rig has functioned to specifications. If someone sees their serial number and notes a mistake or correction, send a reply to the group and I will gladly change it to keep everyone updated. If you have a number to add, send a reply and I will adit and repost the list. I hope this helps everyone! Here goes!

9D021040-(W8RD)
9D021042- UHF Tx delay
9D021168-(KD3KZ&N3QQT)
9D021176
9D021212-(W7EW)
9D021508
9D021544-(AA4KS)-Returned&Repaired (PA unit, no receive SSB,CW,AM)
9D021578
9D021594- 3 returns (hf/6m PA)
9D021604-(KF8YC)
9D021634-(KE1CQ) Replacement radio for 9E032253(7amp on Rx)
9D021653
9D021657
9D021658- 6m power low
9D021685
9D021727-(K5RPD)
9D021762
9D021821
9D021824
9D022066
9E031065- Repaired (PA driver bias circuit)
9E031138
9E031152-(K8DK)
9E031153-(W8KC)-Repair (AM/SSB Rx, No UHF Tx)
9E031198-(W4SSB)
9E031258
9E021435
9E031475
9E031553
9E031664
9E031667

I haven't purchased one, but I am fairly certain that it will 'appear' to be just a cable; but in fact at the computer end of the cable there will be surface mount components that convert the TTL sigs of the radio to RS232 levels. Essentially the same thing as the Yaes ADMS programming cables for their other radios.

958. 10m Breakthrough Problem - bad!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-05 21:20:14 UTC
From: Mark T
Topic: 958 Message: 958

I am receiving bad am broadcast breakthrough on 10m, 17m and 15m (worst on 10m). The freq range 28.500 - 30.000 is unusable some evenings - last night a DL on 29MHz FM at S5, broadcast pumping up and down to S8! - There are many stations mixed together but I have identified one around 17MHz. I know that a reviewer for a US magazine is awaiting an answer from Yaesu but has anybody else having this problem so bad.

Apart from this I am very happy with the radio (although not used 6m yet).

Any information would be appreciated.

Regards
Mark - G0GBD

Dan, Two friends have early versions of the FT100 (I don't have the serial
#s),
and they are both garbled on 10 m. AM transmit. I am waiting for my new one
(it's in route and should be here Monday) and I hope the AM transmit is
better.
The tests we have run are just on 10 m. but I would think the AM is garbled on
any of the bands. AM Receive seems to work fine.

From: Chuck Scott
Topic: 959 Message: 961

Rod:

Ask your friends if they tested AM transmit at full output power, which I
if I remember correctly is the default for AM mode. They should try
setting the output power to 25 W and see if it works better.

The manual is unfortunately sparce on this issue. It does say in the specs
that the transmitter is rated at 25W AM carrier on HF, 12.5W on 2M and 5W
on UHF. There is also a reference in an example on page 47 for setting
transmitter power output that uses AM more and suggests 25%, but that's
it.

If the tranmitter is set to anything significantly higher, you will have
distortion on AM. After all, it is AM. Was this addressed in the QST
article? If not, (I'm no longer a member and don't read QST anymore) they
have an appology to issue to Yaesu.

962. poor recieve quality VHF/UHF

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-06 14:17:24 UTC
From: D. Blair
Topic: 962 Message: 962

I know it is a ham radio, but it advertises wide band receive.
Everything above 6m is poor reception. the local PD on Tband pegs my HT
but barely moves the s meter on this radio.
I like to listen to TV on the way to work, but again my HT picks up more
stations than this radio. FM broadcast radio stations are all over the
place from 6m to 600 mhz.
Using ATAS-100 on HF, and tried several dual bands on VHF/UHF. The ATAS
and duplexer was terrible on VHF/UHF. The dual antennas helped slightly
Is this what I should expect?

Doug

963. Re: FT100 distortion

Cliff:

I think you have it. To put in other words, since at 100% modulation the positive modulation peaks can't be any higher than the maximum transient output, the carier level, assuming symetric modulation, would have to be 1/2 of maximum or less.

Aside from the possibility that they simply didn't address presetting the AM output power level to 25%, there may be other reasons. It appears, for example, that the output power adustment settings aren't exactly linear, meaning that 25% ouput doesn't necessarily occur at a setting of "25". I also suspect that the actual output power at a setting of "25" is very different between radios and perhaps even between bands on the same radio. This would make it difficult or unreliable to setup the radios for the correct power on AM at the factory.

Which all means that they definately should have had a separate section in the manual for transmitting on AM!

Thanks Chuck,

I'll check the power level setting and see what that does. It will be
great if that's all there is to the distortion problem. QST did mention
the problem in their test but didn't warn about reducing the power
level as I remember.

965. Another serial # for Jarod

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-06 22:56:03 UTC
From: John Woika
Topic: 965 Message: 965

Greetings to the Ft100 users group, I have been reading this list now for about a month, On June 5th,1999 I finally bought an FT100 at the Rochester NY Hamfest; from Denver Radio agent. Serial # 9E031496. I put my FT100 into its base station receiving tests today June 6th, here in Rochester NY.

So far it receives A-OK on HF with my multiband dipoles, 6 is dead hear except for a local repeater, 2 is OK likewise with 440. This is the basic receiver test. At 13.8 volts power it draws 1.15 Amps, Tomorrow I will start the transmit tests on all bands from the base station. Next will be the FT100/ATAS100 test on my van.
73s to Cliff, Jarad and all the happy users, Hello to JGA
de John W8JW

966. New FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-07 05:05:26 UTC
From: johan@xxx.xxxx.xxx
Topic: 966 Message: 966

Hello all,
I just received my FT-100, sn# 9E031188, and have played with it on a few HF bands only so far. So far so good.

I also get a lot of intermod in the 27-30 MHz range, mostly very strong Chinese broadcast stations (I live in south Japan).

I noticed that my box had 4 little stickers on/around the white FT-100 label. 3 small ones, green, orange and yellow, on the label, and a larger one, green, next to it. Does anyone know what there mean? I assume quality control and maybe mods/fixes applied (i hope :-))

Since my serial# is close to others that have gone belly up, I am wondering a little ...

Another question I have is about the Comet CA-HVU antenna. How many HF bands does this antenna cover without adding/changing elements to make a band work (I know there is an optional 20m element) ?

Thanks,

Johan, WG7J

Monte,

A firend uses the large triple mag mount for his ATAS100. I bought a Comet 820 heavy duty lip
mount at Dayton, but haven't installed it yet. Both of us have Ford Explorers. I plan to
mount mine on the back liftgate edge at the top. Hopefully my FT100 will arrive
today and I
can check it out.

970. ATAS-100 Mounting and operation

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-07 14:46:58 UTC
From: John
Topic: 970 Message: 970

Hi,

I have been using my ATAS for about a month now with excellant results.

It is mounted on my Pontiac van using a Diamond K400 mount with the very small low loss coax. The mount is at best only half way up on the rear tailgate. I wanted to be able to drive into the garage with out bending the whip part of the antenna enough to distort it.

It works well on HF, 6M and VHF/UHF. VHF/UHF being the weakest area, performance wise. Also find setting the menu option to ATAS-1 works the best. Will not retract if set to ATAS-2 when on VHF/UHF.

Scanners with UHF-T reception (and trunk decoding to boot) are cheap.
This is a relatively serious UHF / VHF weak signal capable rig. Let's
not knock it's RX sensitivity on a band it's not designed for. The
FT-847 simply avoided such criticism by stopping coverage at 512MHz.

To: ft-100 @onelist
Subject: [FT100] poor recieve quality VHF/UHF

From: "D. Blair" <dblair@...>

I know it is a ham radio, but it advertises wide band receive.
Everything above 6m is poor reception. the local PD on Tband pegs my HT
but barely moves the s meter on this radio.
I like to listen to TV on the way to work, but again my HT picks up more
stations than this radio. FM broadcast radio stations are all over the
place from 6m to 600 mhz.
Using ATAS-100 on HF, and tried several dual bands on VHF/UHF. The ATAS
and duplexer was terrible on VHF/UHF. The dual antennas helped slightly
Is this what I should expect?

Did you engage IPO or ATT? Did that make a difference? What
is the description of the problem as you see it? Is the 17Mhz
signal being mixed with some other signal producing 28Mhz?

The reason I ask is that I work a lot of 10m (being a lowly T+)
and have never heard anything like this. Perhaps you are using
an antenna which resonates at the offending frequency? Something
has to account technically for the experience.

Tnx,

Subject: [FT100] 10m Breakthrough Problem - bad!

From: Mark T <g0gbd@...>

I am receiving bad am broadcast breakthrough on 10m, 17m and 15m (worst on
10m). The freq range 28.500 - 30.000 is unusable some evenings - last night
a DL on 29MHz FM at S5, broadcast pumping up and down to S8! - There are
many stations mixed together but I have identified one around 17MHz. I know
that a reviewer for a US magazine is awaiting an answer from Yaesu but has
anybody else having this problem so bad.

Apart from this I am very happy with the radio (although not used 6m yet).

Any information would be appreciated.

Hi Rod.

I have an Explorer and use the ATAS100 with a heavy duty lip mount like you were describing. Mine is a 1998 Explorer and the tailgate has a plastic edge that comes from the top down to just above the tail light where the edge of the tailgate goes from a slant to a more vertical position. This is the point where I have the lip mount.

It has worked well but I do have a couple of concerns. There is some flex on the metal "lip" where it is mounted and a good jar would bend the lip of the tailgate. Also, opening and closing the tail gate puts a lot of jarring on the mount and antenna. I am concerned that this will loosen up the mounts after awhile.

I am thinking about getting some kind of bracket that I can hard mount, "screw", into the vehicle side of the tailgate area. It will come out the same way the lip mount does but will be attached to the back of the vehicle rather than the tailgate. This will also let me get the antenna up higher without having to cut up the decorative edging on the tailgate.

I forgot to add. A good place to remote mount the radio is in the cargo/jack storage panel just above the rear left wheel well in the cargo area. I have mine mounted there with foam packed on the bottom of the wheel well. You can run a good ground strap to any of several holes on the chassis in the area and the remote cables are not too hard to run in the floorboard channeling to the front of the truck.

975. Quiet rx; Updates?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-07 18:54:44 UTC
From: emoxon@xxxxxxx.xxx
Topic: 975 Message: 975

Hello all.
I have seen comments re the box being 'quiet' , and that it fixes itself if
you punch the PTT.

Excerpts:

> Date: 24 May 1999 13:01:23 -0000
> From: bob-baldwin@...
>
> ... If the radio seems quiet after turning it on, just hit the PTT. ...

> Date: Sat, 22 May 1999 14:07:58 -0400
> From: 2K-plus <twoKplus@...>
>
>... I wonder if this happens when you have the noise blanker on (NB)? On
mine
>if the sensitivity is low on turn-on I click the PTT switch and all
>returns to normal. ...

Mine has gone quiet on me a few times after transmitting (on HF SSB,
including auto-tuning the ATAS). Quiet means noticeablly reduced output
overall, i.e. the normal rx noise level is reduced as well as rx signal
(constant S/N??). Clicking the PTT once or twice brings it back. Questions:
does anybody know how this arises and how to fix it, or has Yaesu
fixed/updated this for anybody that's had theirs back for anything?

Also, I've seen here that when Yaesu fixed something, they installed "all
applicable updates". Sure would be nice to know what they've come up with.
Anybody noticed any differences over and above the thing that got fixed?

Tnx to Cliff for the mic ckt.

Add my serial no. to the list, 9E031476. Bought it at HRO here in Denver over the Dayton weekend as they had a few bucks off. Have used it on 2, 440 an 10 meters mainly although I have done some test transmissions on the other bands. Also bought the ATS100 and have it mounted on the back of a Toyota 4 runner. Going to put another mount in my pickup as soon as I can pick up a spare DC cable or those 1/2 inch spade lugs to make one. SO FAR (crossed fingers) no problems experienced, Plan to use it heavily until the warranty runs out. ATS100 is a little slow but given time it usually tunes for lowest SWR. Sometimes gets confused and won't tune at all so I just move it a bit manually and try again.

That's what I thought when I heard about that complaint the fist time.

Then it happened to me. Lost all RX in all modes except FM and WFM. The squelch still looks like it works because the LED above the tuning knob reacts to the squelch setting (goes on and off) even though the RX doesn't work.

It's ToTaLLy CRazY.

Joao:

There have been some receint discussions on comparing the FT-100 to the IC706. Go to the following URL...

http://www.onelist.com/arcindex.cgi?searchval=IC-706&listname=FT100&search=1

Start by selecting digest 83 and search for 706 using your browser's "find in page" function. The other digests listed may have some good information also, but you'll have to search through them.

Let us know if you have any additional questions.

985. 10m breakthrough

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-08 20:11:16 UTC
From: Mark T
Topic: 427 Message: 985

Carried out further tests last night. There are many stations breaking through but I have identified one at 6.200.00MHz (not sure what this is) and BBC World Service at 6.192MHz. The first is breaking through at 29.620, 29.720, 29.650, 29.800 PLUS 21.090 and 24.195. I am receiving the main signal at around S8 on 6MHz and on the other bands at S1-S6.

I am using a cheap CB halfwave antenna (but what performance on 28 and 14!). I am waiting to hear from Yaesu but would appreciate any other ideas.

986. End fed 1/2 wave, 10m problems

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-08 22:08:24 UTC
From: Walsh, Tom
Topic: 986 Message: 986

Hello, to Mark and others with (end fed?) 1/2 wave CB antennas.

What does 'what performance on ...' mean? An end fed half wave
is supposed to require no counterpoise, correct? If there is no
counterpoise, what type of antenna is this at 13.6 Mhz? And at
6.5 Mhz?

Would you be willing to change your antenna system to avoid the
problem you are describing?

Have you tried making a series of loops of excess coax near the
antenna, or sleeving the coax with a 'steel wool' balun?

Some comments/observations...

Recently installed my FT100 and ATAS100 combo... and would like to test it out over a few QSOs on 6... seems to be dead the last few days... anyone interested? Pick a time/freq...

2M works well... made a number of HF contacts on 40 and 15... excellent audio and signal reports... in fact, logged a 5x5 working Moscow on 15 while mobile... so far, so good... no indication of infant mortality!

Have the ATAS100 mounted using Comet's new "quick-release" mount... seems to be solid enough to manage the antenna.

Noise Blanker is excellent (just confirms what everyone else has been saying)... the DSP functions work well... really allowing the user to work those "weak" signals...

Date: 1999-06-09 15:24:19 UTC
From: Lamar Brown
Topic: 988 Message: 988

HISTORY:
S/N 9E031510 went belly up while using on 6 Meters FM. (100 watts @ 22 amps.)
Lost all HF output.

REPAIRS:
Yaesu replaced two chip resistors. Item #s J24275330 and J24205220. No values given.

Quote: "Updated HF/6M TX Driver CKT and S- Meter. "

Does anyone know what the "CKT" is? (Possibly circuit?)
Have these resistors been replaced on other units?

COMMENTS:
I mentioned to Yaesu about the bad AM XT audio. (I had to hold the Mike at arms length to talk even when power set to 25 watts.) I could of course reset the mike gain but then it was way to low for SSB. There was no mention of this when the rig was returned, however the audio seems a bit better.
With po set to 25 watts I can hold the Mike about 4-5 inches and seem to get reasonable audio as monitored on an AM receiver. I have not tried on the air contact yet. By the was, 25 watts is at the 73% point on the 0-100 scale on this rig..
On 6 Meters, the rig still pulls 22 amps with 100 watts FM. Think I will keep power reduced to 50 watts.

Everything looks par for the course for now.

Lamar:
Keep in mind that if you increase the carrier power, you can use higher audio levels without distortion, up to the point at which the tranmitter starts to go non-linear on voice peaks. What I'm saying, is that you may be able to run more than 25 watts for AM and not have to back off on the mike so far...up to a point.
It really helps to have access to a scope in this case. The old trapazoid display for AM is invaluable, but you could just watch the signal output to get an idea of what's going on.

Chuck

John....Do you have the separation kit installed? Even if you don't,
you might want to use a ferrite donut with 3 or 4 turns of coax near the
bottom of the ATAS-100. I had the phanton "X" problem until I installed
the ferrite donut. Dale KC2PZ

994. List of Serial #'s

Yahoo group: FT100 (1998 — 2000)

This is the list that I have compiled from what everyone has sent to the list about their FT100. Unless noted the rig has functioned to specifications. If someone sees their serial number and notes a mistake or correction, send a reply to the group and I will gladly change it to keep everyone updated. If you have a number to add, send a reply and I will add it
and update the list, two or three times per week.

9D021040-(W8RD)
9D021042- UHF Tx delay

I've run into a bit of a problem here, and could use some help. I'm a
pretty new ham, so the answer to this might be obvious to those more
seasoned that I.
I had installed the ft100 and the atas100 on my car. All was fine, with no
trouble tuning. I don't have two antenna yet, or one of those duplexors. I
have to change the cable that comes from the antenna to the right connector
on the back of the ft100. I will of course be getting an antenna for the
upper frequencies. However, after the install, all was great. NO trouble
with tuning. NOw however, I get a high swr reading on the vhf and uhf bands
if I attempt to transmit. The little icon with the X comes on. I took the
ft100 and the antenna out of the car, and into the house, and hooked it up
as my base setup, with no problems. Back tot he car with it, and problems
again. I have looked over the cable that runs from the ft100 to the atas,
and it appears fine- no signs of damage, and it's all new.
I have checked and double checked the ground for the antenna. I scraped the
trunck lid down to bare steel on the inside, where the diamond 400 mounts to
the car. I hooked up a copper cable from the trunk lid to the body of the
car.
Anyone have any ideas here?
William

William....Try the ferrite donut. Get a ferrite donut about 2 inches in
diameter and wrap 3 or 4 turns of coax around just below the ATAS-100.
I had the "X" problem and it would not go away until I put the ferrite
donut on. Dale KC2PZ

W8CBR I have unit 9E031595. No problems with the radio.

Interestingly I bought my unit from the same store 2 hours after W8RD and our serial numbers are significanlty different.

I have used it on 432 ssb, 6-10-15-20-40 ssb mobile with hamsticks, 75-10 ssb with G5RV and FC-20

Some problems with the operator and with the manual.

It is very sensitive to low voltage! I like to carry the radio in a bag and make temporary set ups. I have battery clips on the power cable for the car battery and have gotten poor audio reports until I have made sure, sure, Damn Sure, the clamps are making good contact.

When working correctly I get unsolicited 'good audio' reports. The speech processor seems to work very well. I usually have it set at 50, the default. One QSO on 20 the OM on the other end gave me lots of oppurtunity for in/out trials and up/down trials and he recommended about 33. I have the mike equalization at flat. My voice is not real deep anyway.

I misinterpreted the manual about being able to set SSB power independant of FM power. (many did)

Having tons of fun with the radio and intend to give it a work out portable during the VHF contest this weekend.

Some of my friends though the radio was expensive. It is a bargin when you think of how much a single band, multi-mode VHF radio is and how much more you are getting. I had been accumlating gear to build up a VHF rover type station. One purchase, all done. Plus small, Plus HF, plus DSP, plus wide band receive (havn't found any good use for that yet)

Hello John.

Early on I did some slap-dash experiments looking at different placement and possible mobile mountings of the ATAS-100, with the help of the MFJ-259B. That's a nifty little meter, and it makes it very easy to see what's going on. I did things that made swr 'better' or 'worse', but being anxious to get going, I didn't pause to collect hard data that I could cite here.

I wholeheartedly agree with the ATAS-100 documentation and Yaesutech's remarks about the adequate counterpoise. I had hoped to incorporate a shock spring and foldover mechanism at the base, and mount the whole thing high on the rear quarter of a SUV, but I tried it and ended up not doing so. Having a flat plane extending out in all directions at the base of the ATAS is better. It's now in the middle of the roof deck. There's no hole, it's capacitively coupled to the plane. It's pretty good but it could be even better. Currently, copper tape and aluminum foil are involved. I'm looking forward to vacation when I will have the time to be systematic with the swr experiments. I'm considering punching the hole. When I have concrete results to report, I'll post them here.

John, it seems you are saying your ATAS installation can achieve 1:1 (per the 847) on 40 and the FT-100 can't find it, right? I don't get 1:1 (per the 259), but I do get dandy tuning. Numbers to follow.

73,
Ed, K1GGI, #9E031258

Did you recheck the ATAS setting? Menu 61? I found that if it is set
incorrectly, that there'd be problems with the ATAS100.

Geoff

Dale- It worked. I initially put a ferrite donut inside the trunk, with the
cable around and through it several times. No luck. I then moved it
outside the trunk, to right next to the mount itself.
Poof!
It works!
Many thanks.
William

Just a word of caution here. Has anyone checked if the ferrite gets hot? If the ATAS is properly bonded to the car's chassis (and the radio is as well) it really shouldn't be necessary to add a ferrite. If the ferrite does get hot then you have cured the problem by transfering the RF to heat - not good.

For the record I had similar trouble most of which was cured when I rebonded the earth of the ATAS. The final problem turned out to be RF getting back in through the remote speaker connection. I hadn't used the remote kit screened lead because I had an existing twin core lead in the car from the old (IC706) installation.

Mind you at the end of the day if it works, it's legal!

Cliff, G4PZK

(BTW I got my 2" ferrite at a junk stall at a ham fest)

Topic: 1004 Message: 1004

Hi. Well, I've thought it over and I decided to get the ATAS-100. I was at a crappy little hamfest today and an actual VENDOR showed up- and had an FT-100 for $1299. He was overdue getting ATAS-100s in. We talked for a half an hour about Comet and Diamond HF-VHF antennas. The Comet was so poorly made it was literally falling apart in the new bag. It was $115 and needed an optional resonator to get 20m. The Diamond was $79 and the options... well whatever... I figured at Dayton that the Comet/Diamonds would come to about $160 with all options added.

Although they initially look nicer in chrome (I wonder how long that will last) they seem to be junky. And will not support all bands without changing resonators.

I figured the extra $150 for the ATAS would be well worth it for the flexibility of no-get-out-of-the-car band changing.

And others on the list who have had an opportunity to test both said the ATAS-100 is superior.

I did get a DC-continuous diplexer... or so the guy said. So now I will have HF-440 in one antenna: a nice thing for a car dealer who changes rides fairly frequently.

Some good comments on the ins and outs of the ATAS (:>) sorry...)
lately...has anyone used it with any rigs other than Yaesu? I operate
99% mobile with the FT-100, but would also like the option of using the
antenna on a travel trailer while camping possibly with my old TS-440.
Has anyone discovered a way to manually tune the ATAS similar to the way
you tune a conventional "screwdriver" ant?

Still gittin' wet changing Hustler resonators,
Dave

Dave,

You'll have to come up with a way of connecting +12 to the center pin of the PL259 to make it go out and +8 to make it tune in. It only draws about 250 mills so you don't need much of a supply. I would guess +12 (fused of course) straight from the battery with a 8 volt 3 pin regulator inline for the 8v source. Some sort of inline box with RF chokes and caps to separate the DC/RF where you can insert the tuning voltage into and an inline SWR meter to measure for resonance. It looks like the FT100 sends out about 10 watts during tuning but I have not measured it with a "real" wattmeter, only the indication on the FT100 LCD.

I suppose you could always use an A/B switch box and have the radio on one side and something like the MFJ antenna analyzer on the other. Then you could tune the antenna for a dip and switch it back to the radio. Wonder how accurate that would be?

Dave, where is the antenna mounted on your car? Is it on the trunk, the roof, the front fender? What type of mount are you using? How close is it to the window frame? Did you make sure you had a 'Good' ground connection to the car? You may have to scrape some paint away from where the mounting screws touch the metal on the car. My atas100 works great on 28 Mhz, but it is a bit touchy on 7.225 mhz...

Good luck, 73s John W8JW

Hi Dave,

It sounds like you may have a grounding problem with your installation. On 20, 15, 10, and 6 my ATAS tunes right in every time. On the 17 meters I
sometimes have to tweak it to get a good match but it will always auto-tune to a useable SWR. The only band I sometimes have a problem getting a good
match is 40 and that is probably due to my installation rather than the antenna.

The coil for the ATAS100 is optimized for 40,20,15,10 by having wider spacing near the resonance for those bands. It will tune more broadly on
those bands.

Date: 1999-06-17 01:19:03 UTC
From: Kc7gf@xxx.xxx
Topic: 1019 Message: 1019

My ATAS 100 works fine mounted on the back of my 4 runner using one of the Comet RS520B. (picture uploaded to shared files area) I didn't think it would be strong enough to support the antenna but it was the only mount available at HRO at the time so I bought it anyway.

I made a special bracket to attach to the mount in the same place where the trunk-lip mount piece is and put 3 screws through the bracket into the inside of the rear door. This way the mounting holes don't show when removed later. (Yes it just barely misses the mount when the rear door is laid down, thinking of using a bolt instead of the thumb screw for securing it and providing more holding power)

I have no problem tuning on 10 meters. But occasionally it does miss it's mark or go in the wrong direction when tuning a band. It will also occasionally stop and not continue because of the high SWR symbol. Only solution is to stop it and start over again. If it goes in the wrong direction it eventually stops by itself or reverses and comes at it from the other direction. (but is seems to take forever, the book says up to several minutes)

Someone else said he could not understand why his unit failed and it was only one number off from another one that was good. If you've ever been in a production environment you would understand. Change of shifts, bad day at home, bad component, bad remark from the line foreman while your unit was being assembled, anything can cause side by side units to behave completely different. One of the things we don't find out about dead units is how you use or abuse it compared to someone else. One guy on another list can't understand why his micro ht burns his fingers after talking for a half hour continuos (did he read the part about the tx/rx cycle?) Could it have been a high VSWR that caused your problem? Who knows?
It's all just in the luck of the draw.

Art, KC7GF

Hello Art.
Your remark about going the wrong direction caught my attention, so thought I would offer some things I've noticed that don't quite agree with the book.

It says that stopping manually at hi swr "will not permit further automatic tuning" (pg63), and the system will need a manual refresh. This isn't what I see -- here's my description of how it works.

If I manually tune the antenna and then invoke auto-tuning, the antenna begins moving in the last manually-entered direction, no matter what -- whether it was tuned to resonance or to a hi-swr point. Similarly, if I interrupt auto-tuning by hitting TUN, that locks in the next auto-tune direction. If for example you stop tuning on one band, then change bands, and that last direction was away from the current target, then auto-tuning is going to go in the wrong direction. It will then run for that minute or so (that's the only way it has to be sure it has hit the stops), then reverse back towards the target. That's tuning via the "long path" - hi. But if the last manually-entered direction was "right", the auto-tune heads right toward resonance, and it's really spiffy.

Importantly, after a successful auto-tune, it always goes the right direction when changing frequency or changing bands. So: if you know that it's heading the wrong direction, just give it a quick manual kick in the right direction, and then let TUN take over. For me, auto-tuning always succeeds, so re-tuning is a snap.

So vis-a-vis the book (pg63):
Fourth bullet: 'accept' the manual setting isn't the same as successfully completing auto-tune.
Fifth bullet: it will permit further auto-tuning, but it may not start in the right direction. I don't know what that refresh stuff is all about.

I think I've got this right. Does this fit with what everybody is seeing?

The antenna and the auto-tuning work really great for me. You really need a good counterpoise/ground. It would be interesting to know how many segments of the tuning bargraph (or even real swr numbers) people are getting when they have good/bad/flaky tuning.

Dear Friends, my ft 100 was buyed at april, and at the time its work ok. i have worked with today and my surprice! the radio out 150W, I said Imposible, i have checked it also in my dumiload and the response its yes 150W obviously i have also used 2 meters, the other surprice! the power meter diplay say only 50W, i have tried to change the power with the menu and i also can vary from minimum to 150W.

this problem ocur only in hf bands from 160 to 50 Mhz,

all work ok in vhf and uhf.

Alberto:
Just curious, what are you using to measure the output power? Also, what mode are you testing it on (cw,fm,...)?

Has anyone experienced difficulties with an FT-100 AFTER it has been returned for the "dead receiver, all modes except FM/WFM?"

I hope mine comes back today, and I'm nervous, been missing it for 20 days now.

Just got the UPS shipment and my FT-100.

As reported here, it was returned for the "dead receiver, all modes except FM/WFM" and no UHF TX.

Here's what gets "fixed"

FET MRF9745T1 VX-1R
FET SGM2016AM-T7
IC IR3M03N2
? ISS294 TE85R
Two chip resistors
Two chip caps
One ceramic cap

Just $10.14 worth of parts!

I think YAESU charges $50/hour labor, the labor charge was $100. Fixed for free of course, under warranty.

1028. FT-100 Power Consumption

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-19 08:19:07 UTC
From: ddestafeno@proaxis.com
Topic: 1028 Message: 1028

I would be interested to know if anyone has done or would do some sort of power consumption based on power output of HF thru 50 and 144 & 440. I'd like to see how many "amps" are drawn at 1 thru 5 watts and then maybe every 10 watts after that.

Also earlier someone said they had a different QRP setting after there radio came back from being repaired. If that is true, what is the origional low power settings and what are they after your radio gets sent in for repair.
Thanks in advance,
David (KD6VLR)

From: Manuel Maseda
Topic: 1030 Message: 1030

Has anyone been able to get a straight answer out of Yaesu as to why the FT-100's are failing? Is it a defective batch of parts or a design problem? Will they all fail sooner or later? Are they making a mod to the ones being sent in for repair or are they just replacing the parts?

Thanks,

Manuel W4SSB

1031. Re: Problem Cause ??

1033. FT-100 "failures"

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-20 11:03:07 UTC
From: Paul R. Valko
Topic: 1033 Message: 1033

As a former factory service technician, I assure you that no company is going to come out and say that a product was designed or assembled defective - except for US car companies, and that's only because of the government.

That is why it is important to keep this list updated with the status of our FT-100s.

Now, even though MY 100 bit the dust, and was repaired, looking at the list we currently have, there is no rhyme or reason to the failures. Mine died, but my good friend who has a 100 just one serial number off of mine, his is fine.

Go figure.

1034. HF dies after 37 days in service

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-21 03:01:58 UTC
From: David O. Ausley
Topic: 1034 Message: 1034

Hello everyone,
Well, it was my turn this weekend! After having a blast working a couple of good 10M openings in the last couple of days, my HF transmit has gone kaput! Everything seemed fine on 10 SSB Saturday, but this morning while preparing to check in to the Alabama 75M net on 3.965Mhz, I noticed the output was gone on 75! As my heart raced fearing the enevitable, all of my FT100 fears were confirmed as I carefully and sadly checked each band to find the transmit dead on 10 meters and below! After 37 days, I actually thought this would be one of the "good ones".....sigh

Here is an excerpt from my explanitory letter to Yaesu:

Subject: Warranty repair of Model FT-100 transceiver, S/N 9E031639

Dear Yaesu:
I am returning my FT-100 transceiver for warranty repair due to a failure of the HF transmitter section after only 37 days in service. While operating on the HF bands this weekend, the output power on 10 meters dropped off and I noticed as I went down in frequency, the output power was less and less on each of the HF bands. (Practically no output at all on 80 meters)

The following conditions were observed:
With the "HF TX PO" (Menu 21) set at 100, reduced power is observed on 6 and 10 meters with output continuing to drop off as you go down in frequency. The following procedures were tried to eliminate possible operator error -
? Transmitter was tested into 50 ohm dummy load as well as antenna
? Stepped through all menus and checked for proper settings
? Performed Menu Reset (Home + Func + Power On)
? Performed VFO and Memory Reset (Dsp + Lock + Power On) (All of those hours of programming memories!!!!)

None of these procedures seemed to affect the problem so I assume the worst. Please repair and update as needed and please notify me of an estimated turn-around time.

Well, tomorrow I call RT Systems (Dealer where purchased at Dayton) and see if they can help before sending it to Cerritos. Wish me luck and everyone have fun on Field Day....I'll be QRT!! (You can send your "Klenex" donations to my callbook address Hi Hi!!)

We'll keep you posted

TO ALL YAESU OWENER OF THE FT-100 AND ATAS 100 ANTENNA,
When you call yaesu and try to get some answer about this radio they kept tell you noting. what is the secert about this lemon of radio. mind been back twice for repair and my atas antenna when up in smoke with 100 watt of power. what going to happen when the warrenty run out everybody is going to pay to get this radio repair everybody should send a complaint to the b.b.b. and if that does not work start classaction lawsuit.

Yaesu claims 2 percent failer how about 4 percent that is the real facts.

dave.

1036. ARRRrrrrg!!! Died AGAIN!!!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-22 01:46:56 UTC
From: Paul R. Valko
Topic: 1036 Message: 1036

Gang,

My 100 came back from Yaesu Friday and worked through the weekend. This morning I discovered that the UHF section was NOT TRANSMITTING AGAIN!!!

Exact same problem as the first time it failed, go to TX on 440 and the SWR alarm comes on and no power out. This is into a 50 ohm dummy load.

That problem was the very first thing mentioned in my note to the repair tech. I even spoke to Yaesu about it at Dayton, before I sent it back, they knew about the UHF TX problem.

I'm more than a little *issed off at Yaesu right now. I don't expect miracles, but I at least expect a problem that they have seen more than once get fixed right the first time.

Let me see if I settle down by tomorrow when I call them up. Hopefully they will do the right thing.

Dave:
Sorry you're having a rough time with your radio. Also sorry that you're unhappy with Yaesu. You should know however that in most cases a company is more than willing to work through a problem as long as you're willing to let them. If you take an attitude with them, you run the risk of not getting their full support. If you call them up and yell at some poor tech about how much of a lemon you received and how you're going to start a class action lawsuit, you're most certainly not going to get a satisfactory response. Also, they're not clairvoyant, so they can't tell you any more than they know. If you ask them questions for which there is no reasonable answer, you can't expect one, and if you're not willing to accept the answers they give you, then what point is there in asking. What I'm saying is that if, for example, you ask them simply "Why are all these radios failing?" and they answer with "A variety of reasons, but we're watching this closely.", what more do you want?
Also, any time something fails it's wise for everyone involved to take a close look at what they're doing. If you are unwilling to consider that there may be some aspect of your use that is different from what others may be doing and is exposing a weakness in the radio or antenna, you and Yaesu both may never find a solution. Further, if you take a deep breath and work the problem step by step in a cooperative manner with Yaesu, you may be surprised at how considerate they can be. Even if one of their techs has a bad day and slaps your radio back together before making sure it's solid, what end is served by calling the BBB and starting a class action suit. Be nice, I think you'll be surprised. I mean after all... as an alternative...you could be dealing with Kenwood!!

1038. Dropped off my broken toy today..

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-22 03:30:05 UTC
From: David O. Ausley
Topic: 1038 Message: 1038

Called R.T. Systems this morning to get their advice on how to handle the warranty repair of my "HF Challanged" FT100. Low and behold, they said just "bring it by and we'll take care of it!" I forgot that they are an authorized Yaesu repair center...so my new "QRP" rig is being repaired only 25 miles away instead of having to fly to the West Coast. Their best guess for turn-around is about a week...still doesn't help for Field Day this weekend though. Stories have been pretty scarce about repaired rigs lately...anyone have comments on how their rigs are holding up after being repaired? Also, I asked about any "updates" or other mods that would possibly be done while in the repair shop....RT's comment was basically nothing would be done except the necessary repairs. Has anyone else had one of their warranty repairs to include any updates or mods?

I'll have to admit, I did look closely today at a new FT100 and an IC706MIIG sitting side by side and a fleeting twing of doubt ran through my mind......nah, I still like the looks and all the goodies on the FT. Guess I'll have to be content with playing with my VX5 for the next few days. Picked up a copy of the new ADMS-1E software and it sure makes poking around in the little rig's brain a lot easier! (Wish it worked with the FT100)

Updates as they happen.

1039. FT100 ATAS update

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-22 10:46:49 UTC
From: dale brown
Topic: 1039 Message: 1039

Here is the latest on the transceiver and antenna combination.

Installation:
ATAS on bracket off rear bumper
FT100 separation kit with face plate on console.

Duration:
10 weeks of 2 hr per day commuting

Frequencies:
60 percent 440 Mhz
30 percent 144 Mhz
5 percent 14 Mhz
5 percent 28 Mhz
I have tuned up on 53 Mhz several times and made one short contact

All functions continue to be just as when purchased. Dale KC2PZ

1040. FT-100 & ATAS antenna

From: John
Topic: 1040 Message: 1040

Just an update on my use of this combinations. Two different situations about 2 weeks apart. Both from Massachusetts mobile.

First:

In about thirty minutes or so on a rainy Sunday afternoon I worked the following:
The Heath Special Events station in Michigan on 40M I think
Then a Solvenia station on 20M
and finally two stations in the midwest on 6M
all without getting wet or leaving the car

Second, this last Sunday morning
A station in Tokyo
A mobile station in Yokohama
another base station in Yokohama
all on 17 meters
then a K3 in PA who just wanted to tell me how
good the audio on the FT-100 was

Great combination, recommend it highly even though my first FT-100 died.

Gang,

My 100 came back from Yaesu Friday and worked through the weekend.
Yesterday I discovered that the UHF section was NOT TRANSMITTING AGAIN!!!

Exact same problem as the first time it failed, go to TX on 440 and the
SWR alarm comes on and no power out. This is into a 50 ohm dummy load.

That problem was the very first thing mentioned in my note to the repair
tech. I even spoke to Yaesu about it at Dayton, before I sent it back,
they knew about the UHF TX problem.

I'm more than a little *issed off at Yaesu right now. I don't expect
miracles, but I at least expect a problem that they have seen more than
once get fixed right the first time.

Let me see if I settle down by when I call them up. Hopefully
they will do the right thing.

TO ALL YAESU OWENER OF THE FT-100 AND ATAS 100 ANTENNA,
When you call yaesu and try to get some answer about this radio they kept tell you noting. what is the secert about this lemon of radio. mind been back twice for repair and my atas antenna when up in smoke with 100 watt of power. what going to happen when the warrenty run out everybody is going to pay to get this radio repair everybody should send a complaint to the b.b.b. and if that does not work start classaction lawsuit.

Yaesu claims 2 percent failer how about 4 percent that is the real facts.

Dave:
Sorry you're having a rough time with your radio. Also sorry that you're unhappy with Yaesu. You should know however that in most cases a company is more than willing to work through a problem as long as you're willing to let them. If you take an attitude with them, you run the risk of not getting their full support. If you call them up and yell at some poor tech about how much of a lemon you received and how you're going to start a class action lawsuit, you're most certainly not going to get a satisfactory response. Also, they're not clairvoyant, so they can't tell you any more than they know. If you ask them questions for which there is no reasonable answer, you can't expect one, and if you're not willing to accept the answers they give you, then what point is there in asking. What I'm saying is that if, for example, you ask them simply "Why are all these radios failing?" and they answer with "A variety of reasons, but we're watching this closely.", what more do you want?
Also, any time something fails it's wise for everyone involved to take a close look at what they're doing. If you are unwilling to consider that there may be some aspect of your use that is different from what others may be doing and is exposing a weakness in the radio or antenna, you and Yaesu both may never find a solution. Further, if you take a deep breath and work the problem step by step in a cooperative manner with Yaesu, you may be surprised at how considerate they can be. Even if one of their techs has a bad day and slaps your radio back together before making sure it's solid, what end is served by calling the BBB and starting a class action suit. Be nice, I think you'll be surprised. I mean after all... as an alternative...you could be dealing with Kenwood!!

Hi John

Thanks for the info on the BBB.

We don't have that over here. We do have an organisation called "Trading Standards", get this, it use to be called "The Weights and Measures Department"!!

They have some powers to enforce the sale of goods act which states amongst other things that the device must be fit "for the purpose" etc. It only usually applies if I go out and by some cement and they don't provide the correct weight etc. I'm not sure if they would take up the case of a dodgy radio (mines OK and they dealer was as well BTW).

Not that it is terribly important, but the BBB is NOT a government agency. They only have teeth in such cases as people call them first before dealing with someone. The good thing is that companies do not like negative recommendations from them so they do respond. Of course, this is all moot because Yaesu has done a fine job on customer service for my rig that was sent back. heck, they even paid the $25 shipping charges. Yaesu has it right...

1048. ATAS-100 Frequency coverage & tuning

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-23 00:17:59 UTC
From: Mike Valentine - W8MM
Topic: 1048 Message: 1048

Hello all!

I am considering an FT-100 with an ATAS-100 for my SUV. I particularly want to receive 42-43 MHz well while on long trips here in Ohio, in addition to normal hamming around on a daily basis. From what WA4ZRG in MD tells me about his installation, I should probably have a separate good 146/440 antenna on a duplexer, since he has much better results that way on his Expedition in rural MD. This presents no problem for me.

Question 1): Will the ATAS antenna work at all well @ 42-43 MHz, and can it be tuned there without transmitting like my old HiSierra screwdriver?

Question 2): Why isn't the ATAS listed to work on 17 or 12? Has anyone tried it? What happens?

Question 3): Can one tune the ATAS to listen on 27 MHz while travelling in the boonies and can one tune it there without transmitting? I have my first 40 memory channels in my FT-900 programmed for easy QSY on 11 meters so I can listen to truckers while on long trips for road information.

Question 4): Has anyone installed an ATAS-100 on a newer Toyota Land Cruiser? How did you do it mechanically?

OK enough questions. Thanks for the answers.

Mike - W8MM

Man, when are you people gonna get it? Yeasu has a complete line of superior equipment, and one great big, lemon. The FT-100 is a bust! I know that really ticks you guys off that refuse to believe you made a poor purchase, but it's just the awful truth. I'm gonna just use my FT-1000D in the shack, and my Mk11g in the car. They both work.

Oh - BTW, according to HRO California the failure rate is more like 50% that they *know* of. And with my own experience, and by the posts I see out here, that sounds about right if not low. What did you *expect* Yaesu to say?

I thought a lemon was when something had to be fixed three times? Mine broke, and was fixed in a week by Cerritos. I have not had a problem with it since. And after reading the review of the MKIIg in QST, I am confident I have a good radio. Of course, this is my first Yaesu and I own only ICOM equipment HF stuff, so I may be partial to ICOM.

From: Paul R. Valko
Topic: 1052 Message: 1052

Just dropped my 100 off for another trip to Cerritos. You recall the UHF TX failed again.

Last night I dug into it myself (I used to do that for a living before the internet came along). From what I figured out, there is a mechanical failure on the band pass PCB. Either a micro fracture on a trace or one of those damn plated through PCB holes.

In either case, it'll me trouble. I asked them to PLEASE replace that board (or the rig). I've fought with those problems in the past on Sony TVs, and in a harsh mobile environment, I shudder to think of the 100 failing every couple months.

So I don't blame Yaesu for missing this the first time. When the tech "updated" the rig, it's quite obvious they pulled that board (or at least worked on it, I removed a small solder splash from a coil!) and it worked when he or she tested it on UHF.

I am SOOOOoooo bummed out I don't have the rig available for Field Day!

Can we get a show of hands - who among those with 'dead' FT-100's had installed options, or even opened the case? The radio is very tightly packed, and perhaps some wires are getting pinched. I had a tough time installing the CW filter and FTS-27 TSQ. I have experience reworking fine pitch surface mount components, but this was still fairly delicate.

1054. Show of hands...

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-24 10:19:11 UTC
From: David O. Ausley
Topic: 1054 Message: 1054

Paul,
I feel your pain having no fig for Field Day, it is a real bummer! I'm hoping that mine will be back by this time next week though. A couple of questions...you said that you suspected a cracked pc trace or plated hole problem when you looked into the rig..what is your overall opinion of the quality of the construction and overall design? Did Yaesu just try to get to much stuff in a small container? My first thoughts are that most of these problems have been heat related....but I always ran mine under the A/C vent when mobile and I never noticed it overheating. There just doesn't seem to be a pattern of failures that I can see. Even the guys at RT Systems where I returned mine for repair, said "well this is a new problem" when I discribed my loss of HF output! Oh well, guess we are all the guinea pigs for what will eventually be a good product line!!

Tom,
You asked for a show of hands of those who had failures after opening the rigs for adding accessories, etc. Good idea.

Problem: lost HF power output (VHF,UHF, ok)
S/N 9E031639
Age: 37 days
Case never opened

Good luck to everyone....lets hope the posts get more positive here soon...this is really depressing!

1055. ft-100 and Atas

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-24 11:25:57 UTC
From: Paul Barnes
Topic: 1055 Message: 1055

I have had an atas now for well over 12 months I first used it with my Ft-847 and now with the Ft-100 all I can say about it is that it is the next best thing to sliced bread.
The only problem I have had with the Atas is after heavy rain water gets into the so-239 socket at the bottom and the antenna will not tune if you remove the Atas and clean away the moisture it is fine.
My first Ft-100 was used mobile on the way home from the shop on 40mts for two hours no problems it was then took into the house and used on 2mtrs while talking on the radio and turning the output power down at the same time from in the menu, the radio the died. No output power on uhf or vhf and it would over heat to a point you could not touch it while on recive.
My supplier (Martin Lynch) set out a new radio,on reciet my one went back this one has been used every day now since 7th april 1999 with no problem (touch wood).
My personal preference is the Ft-100 it out preforms the Ft-847 by far but the Ft-847 has some features the Ft-100 does'nt.
I hope you get your probs sorted and enjoy the Ft-100 as I am.

Very nice radio Yaesu

All the best Paul

PRES> Hmmmmmmmm. You have me thinking...

I got my FT-100 in March. I have NEVER transmitted on it, not even plugged
in the mic. I have done about 5 hours of listening without a hitch except
for one small event involving the internal beep generator- and I can't
recall exactly what the complaint is but it sorted itself out. In all the
listening it never got hot... I understand that if it is bad it might show
symptoms even in receive mode.

I got the AM filter, CTCSS decoder and remote kit at Dayton. I am fixin' to
install them in the radio, and then put it into use in a car.

Does the list strongly suggest a bunch of dummy-load tests before opening up
and installing? And if yes, exactly what tests should be performed? 10
minutes on low power? High power? UHF? VHF? HF CW/AM?

Thanks in advance...

I haven't read the QST review, so I don't know what they said. I do however have both an FT-100 and an IC706MKII (not the G). I spoke with Icom at length at Dayton regarding the changes in the G model and while it adds some features, in my opinion it does not solve any of the significant problems of that radio.

I've indicated before on this list that while the 706 is technically a pretty good radio (with the exception of the awful noise blanker), it does have some operational quirks that I feel make it a poor choice for a mobile. These are particuarly related to repeater operation.

I'll have to borrow a copy of QST to see what they say. Should be interesting. Regardless, the FT-100 is the one in my truck and the 706 is sitting on the bench at home waiting for some appropriate use or sale. BTW, they both had to go back to the manufacturer--the FT-100 for a UHF amp failure and the 706 for a total system failure.

From: John Roe
Topic: 1060 Message: 1060

Hi,

First, no complaints I like my FT-100 and ATAS very much!

However, I seem to have a new problem that I do not recall seeing anyone report here before.

Last, used the radio on HF 17M last Monday evening. Everything worked fine talked to station in Europe.

Used in on 2M FM Tuesday & Wednesday, no problem.

Tried HF SSB on Thursday and there was no audio at all. Tranmitter seems to be working. ATAS tunes fine. But no audio.

Played around today with radio, seems there is no audio on any HF band in SSB modes. However if you switch to FM mode the audio comes right up.

I have tried resetting the radio, no change.

Before I pack it up and send it back to Yaesu, does anyone have any ideas.

Thanks,

John...KE1CQ

Sorry for the last one, I double clicked in exchange on the 'reply' button, and the 'send' button
came up under the second un-needed click...

Anyway, do you have the Squelch control set to be RF-Gain for modes other than FM? This
is one of the menu configuration items. Can't remember right now which direction reduces
RF gain, but maybe that might be the problem. Hope that helps, sorry I don't have the manual
or radio handy right now...
-Tom, KB7EFZ
ps: Please continue to send in, if you have had a failure, whether you opened the rig for any
reason. I have only one reply regarding a failed rig, and it was never opened. I'll summarize
to the list when a significant number of replies are tallied.

I sent my FT-100 in to Yaesu for warranty repair on June 10, 1999 and got it back June 22, 1999. It had a 5 second delay on 70cm FM transmit. Yaesu replaced 5 chip resistors, 3 chip caps and a chip diode. They also installed all applicable updates, repaired incomplete solder on P.A. unit and tested all functions and aligned unit to specs. They changed 5 values in the second set of menu functions (F03, F07, F19, F53, F54) see page below.
My radio works perfect now! SN 9D021042

Ref the IC706MKII repeater operation.
This may be of interest to you. KO6YD makes a
gadget called "The Autoshift 706" which automatically
sets up the offsets for 2, 6 and 10 meter operation.
You can get the details at www.ko6yd.com
Have fun. 73, Jerry.

Hi,

Thanks for all of the ideas. I will give them a try.

The RF gain / squelch sounds like a possibility.

If not I will pack it up after FD weekend.

Thanks...73's....John....KE1CQ

Subject: [FT100] Need an idea or ????

Hi,

First, no complaints I like my FT-100 and ATAS very much!

However, I seem to have a new problem that I do not recall seeing anyone report here before.

Last, used the radio on HF 17M last Monday evening. Everything worked fine talked to station in Europe.

Used in on 2M FM Tuesday & Wednesday, no problem.

Tried HF SSB on Thursday and there was no audio at all. Tranmitter seems to be working. ATAS tunes fine. But no audio.

Played around today with radio, seems there is no audio on any HF band in SSB modes. However if you switch to FM mode the audio comes right up.

I have tried resetting the radio, no change.

Before I pack it up and send it back to Yaesu, does anyone have any ideas.

Thanks,

John...KE1CQ

I'm 99% certain that your FT-100 has the same problem that several others
have experienced, and needs to be sent in for retro-fit.

Personally, I think you may want to get ahead of the
blown-my-rig-up-at-Field-Day, rush.

Hi Dave,

I have a FT-100 and an ATAS and have not had any problems as of yet. There are folks with what seems like classic failures in the FT-100 but you are among only one or two others here who have had any problem with the ATAS-100

I have a 1996 Ford Explorer that I need to find a way to get power to the radio - FT100. I have used the power outlet for the VHF/UHF radio I had prior, power for 50 watts okay. I dont believe that is a good source for power that is required for HF. Has anyone have a FT-100 installed in a Explorer and how have you got the power routed from the battery. Ford here in Atlanta, GA doesn't help.
Sincerely,
Terry

Terry,
On my '97 Ford Explorer there is a large rubber grommet on the left side of the fire wall where the shift lever cable enters the engine compartment. I punched a hole through that grommet and fished the cable through the hole. It will come out under the brake vacuum tank. From there you can run it to the battery.

If you want to use the separation kit:

Run 8GA under the body to the backseat. There is a grommet under the carpet in the back driver's side. You can mount the radio in the little space there and bring the power cable;e up without damaging the carpet.

Terry

It's essential to connect this kind of radio direct to the car battery. My current installation only connects the +ve (RED!) wire through a bulkhead grommet to the battery. I use the car's metal chassis for the earth. The radio is under the front left hand seat (passenger side as we drive on the left). I have bonded the -ve to the seat anchor point using a large spade terminal. I've also made sure the antenna earth is bonded to the chassis at the back end. On Sunday we have a major rally radio and I'll buy a new mount to update my old, weather pitted one.

This is the first time I haven't run both +ve and -ve direct to the battery. It works well for me at least. You'd better use thick wire as well. 8 gauge is the stuff to use.

The car is a Subaru Forester BTW.

Cliff, G4PZK

I purchased my first FT-100 (ser# 9DO21628)and ATAS-100 at Dayton last month. I also purchased the AM filter, FTS-27, and separation kit. I installed the filter and tone board with no problems. I ran the rig on the bench for about a week to get it programmed the way I like and get used to it.I then installed the rig in my car;radio in the trunk and control head on dash. After five days of working good, I turned it on and the thing had no rx and no tx.I did resets and reattched the control head to main unit but to no avail. I returned the rig to my dealer and he replaced it with a new one (ser# 9EO31268).
I just got back from vacation and it worked fine.I hope it holds together. I love the radio but my confidence level is not high that i still won't have any problems with this rig.

Hi Cliff, I was reading your installation and I have a Legacy wagon (Subaru). You know by connecting to the body that way with the ground you are only going through a #10 wire at the battery. The ground cable of the battery goes to the motor, and the motor has a ground strap(I think #10) going to the body. So you are relying on that ground strap on the motor and connection of the ground cable to the battery and the #10 from the chassis that goes to the battery terminal. Some vehicles have a fuse on this #10 that comes of the ground terminal to the chassis. I like straight connections to the battery, it eliminates ground loops. Although if it works for you, than thats the way to go. But how ever it is done be cautious.

Here is a different style Ford truck with the same challenge. I own a 1995 Ford Econoline 150 Conversion van. It's great for over the road travels. The battery is mounted on the left front of the engine compartment. My FT-100 radio is mounted on a wooden rack just above the front 'middle' hump.

Question :how do I bring the power feed directly from the battery??

Answer: I looked all over the fire wall for a 'large' grommet. I had noticed that the brake pedal push rod goes through a 3" diameter rubber boot or grommet through the floor into the engine compartment. I tested my thesis with a 48" whip stuck through the rubber boot/grommet, with bright lights shining under the truck I found that it came out right to the left of the steering column. Additional searching proved that the wires would not be in danger of moving parts. I then placed a Radio Shack protective plastic cable shroud, 1" x 4 ft long over the cable from the rubber boot to just near the battery. I wasn't certain how much 'heat' the Yaesu cable would take. I placed black electricians tape over the slit in the boot to help keep water out of the inside of the vehicle. No problems. :-)
Good luck & 73s de John W8JW

Hi Mike

I was going to say that I checked that the Forester has a ground strap direct to ground - when I realised I hadn't! My last car I noted did have one but you are quite right the Forester ground is bonded via the motor, the alternator in fact, I think. I agree with you about direct connections to the battery - I've ALWAYS done that before. The reason I didn't is due to the FT-100 manual which suggests using the chassis. It does work pretty well but I may add a 0V line after your comments and looking at it. Funnily enough I actually prefer the bonding to chassis method. In addtion to obviously being easier I would think that the massive amount of metal most of the way from the radio to the battery would reduce the impedance significantly whereas if you use a separate 0V from the radio to the battery you can end up powering the radio via the antenna coax if things go wrong! I guess in theory you still can but the very short bonding from the rig to the chassis is pretty well protected being inside the car. I also have never liked having fuses in the 0V line for the same reasons about. I've found that on HF it is absolutely essential to bond the 0V at the antenna to the chassis.

Thanks for the comments, I take it you use both wires to the battery?

My FT-100 is still FB as well although as I mentioned I'm buying a new antenna mount tomorrow.

Is your Subaru a Turbo BTW?

Cliff

Gee, thanks for straightening me out. I guess I only imagined working Romania and Bulgaria on 20 SSB last night, or ragchewing for 45 minutes with a friend on 2m FM the night before. I'd better try to get my money back. "Hello, I'd like to return my FT-100 ... no, *I* haven't had any problems with it, but this guy on the Internet says it doesn't work."

Now I don't deny that some people have had problems with their radio, and I don't mean to belittle them; they have a right to be unhappy (although the prevailing attitude seems to be "looking forward to getting it back" rather than "I made a mistake"). And I would advise anyone considering a purchase to take the reported failure rate into account when comparing radios -- as with any other major purchase. (Consider also that early purchasers = pioneers -- but I knew that when I bought mine.)

But I'm tired of hearing what a bad purchase I've made. I've been using this radio for nearly three months, I haven't had any problems with it, and I'm generally pleased with my purchase. I think it's increasingly likely that it's not going to fail, but if it does, I'll deal with it. I'm sure I'm not the only person who's satisfied with their FT-100, but it's only natural to hear more about the bad experiences.

Hi Cliff, I do use the direct battery connection , but I also have a #8 ground from radio chassis to car chassis(a short one) in the vehicle. You see in my car and maybe yours too, the computer is on the foor board in the passager side of the car. I had to double sheild it(the computer) because I have the radio on a shelf just above it (the shelf is straight out from the seat to the glove box which puts the radio 1ft. above the computer).I put the radio and the mail that I deleiver there. I agree with you the chassis is probley a lower impedence, its just all the connections it has to go through to get to the battery.
My car is not a turbo BTW.

Hi Dan

You might want to check your clock, It says: 6-26-80

Your battery might be weak.

I have 2790 messages and it goes right down to the bottom.

1088. Re: Question about Ford Explorer

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-27 19:15:04 UTC
From: Cliff Bryant
Topic: 1073 Message: 1088

Hi Mike

No sign of the computer on the floor in the Forester. When I bought the car I originally had an IC706 MK1 under the passenger side, and a 200W 2m linear under the driver's side. I would think that the computer (ECU) is hidden in the dash board somewhere. I will add an earthing strap directly to the chassis from the battery. If you are running 600W mobile (more than our legal limit!!) then you *definitely* need a good installation.

FB about 6m. Nothing going on this side much although I haven't listened on 6m for an extended period of time.

I couldn't get the new antenna mount at the radio rally BTW, they don't seem to make them any more. I only spent 10 UK Pounds (15 USD) on some patch leads so the wallet wasn't too beaten up.

I'm curious: with 600W (is it an MFJ solid state linear I wonder) do you get any problems with RF getting back into the microphone circuit? That's a lot of power for such a short distance. I would think that the near field levels would probably breach European safety levels, USA as well of course.

Cliff

From: Deb Bilacic <dbilacic@...>

Hi Cliff, I do use the direct battery connection , but I also have a #8 ground from radio chassis to car chassis(a short one) in the vehicle. You see in my car and maybe yours too, the computer is on the foor board in the passager side of the car. I had to double sheild it(the computer) because I have the radio on a shelf just above it (the shelf is straight out from the seat to the glove box which puts the radio 1ft. above the computer).I put the radio and the mail that I deleiver there. I agree with you the chassis is probley a lower impedence, its just all the connections it has to go through to get to the battery.
My car is not a turbo BTW.
6m here has been open for the last week,

1089. FT100 PASSES FIELD DAY TEST

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-28 00:55:54 UTC
From: n8ulj@xxxxxx.xxx
Topic: 1089 Message: 1089

During my Radio Clubs Field Day operation over the past weekend, my FT100 was one of the four radios we had on the air and I must say the FT100 passed with flying colors. There were probably 5 different operators that used the FT100 over the course of the event and logged well over 400 contacts, primarily on HF. No problems were reported with the 100's operation by any of the Op's and two even indicated they liked the radio so much they would probably be purchasing a 100 in the near future. There were also a few contacts on VHF/UHF and 20+ contacts on 6M, again with no problems being noted. Have had my FT100 for 3 month now and has worked as advertised.

1091. Failed FD test

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-28 12:39:30 UTC
From: Robert Gauss
Topic: 1091 Message: 1091

I am sorry to say that my FT-100 failed its FD test.

It was set up as the VHF station and about mid nite Saturday, after about 90 6m ssb contacts, 10 2m ssb and 2 432 ssb, the 6m PA stopped working. Did not show excessive heat. It seems to be the classic failure, no output, all lowbands. VHF UHF works, all receive works. No ALC on lowbands. Yes I am in band, (made that mistake once and thought radio was broke) My menu settings are OK, did reset anyway to defaults.

After field day, tried it on dummy load. Radio does silly things, With dummy load in ssb mode shows 'antenna off' icon. On FM some power shows but with high swr indicated. It could be something is wrong with the power sensing circuits rather than PA. Will send back today.

Before that the radio has been fine. Good reports, no excessive heating. I have been using for a number of portable/mobile setups with great success.

Actually was a very good radio for field day. Beginners could walk up and within seconds be using the radio. Once set up, it was just a matter of tune them in, work them, tune again, push band up / band down. We do not contest on FM. Had 2 meter & 432 beams and used duplexer at antenna to split 2 & 432 signal. One low loss feed line. No cable switching. 6 meter beam on its own line of course.

After failure, radio was replaced with FT-847. Nice radio, but to complicated for most of our inexperienced operators.

As an aside comment. We used a TS-440 for one of the HF stations. It worked without failure but boy did in run hot! Big heat sink but got so hot at times you couldn't touch it. Several times we just took a break to let the radio cool. FT-100 was better in that regard. Two other stations on site ran TS-850's, (one of them the radio I sold to buy my FT-100). Ran strong and cool, not a hint of problems.

Second aside. We used call W8RD. Maybe you worked us on Field Day.

Hi Terry,

I run power to my 1998 Explorer right from the battery. There is a fairly large white grommet type seal where either the speedometer or some such goes through the firewall. You can easily poke the A leads next to this and through the firewall. My FT-100 is mounted in the back cargo space in the side compartment that is for the jack. If you pull up the floorboards by the door you will find
that there is a cable channel that runs all the way to the back seat. I just fished the wires up through the same path and up over into the side panel. Everything is out of sight and protected.

Hi Bob

The failure sounds identical to mine (and others). If so the problem is with the HF PA driver transistor. The finals on mine were OK and indeed the driver was as well but some of the associated circuitry had fried. I reckon that the resistors around the circuit as simply dissipating too much heat and failing or worse desoldering. Anyway they fixed mine within 4 days amd it's been fine ever since. For the record I was told that if you have the fault it will manifest itself quickly otherwise it'll be OK for the long term. The classic 'bath tub' failure graph. What I'd like to know is if the fault is due to over heating surely the radios in a batch will have the same components fitted? Hence most in the batch should fail. Anyway hope you get it back real soon.

Cliff

1097. Smoking FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-28 23:56:41 UTC
From: John in Roseville
Topic: 1097 Message: 1097

I sent my FT-100 in to Yaesu for warranty repair on June 10, 1999 and got it back June 22, 1999. It had a 5 second delay on 70cm FM
transmit. Yaesu replaced 5 chip resistors, 3 chip caps and a chip diode. They also installed all applicable updates, repaired
incomplete solder on P.A. unit and tested all functions and aligned unit to specs. They changed 5 values in the second set of menu
functions (F03, F07, F19, F53, F54) see above. My radio works perfect now!

I spoke too soon, the problem is worse and the radio smokes now! I'm going to send it back again.

So, I went to the car dealer, and he told me about an excellent product:
"If it doesn't blow up in the first 300 miles, it'll probably be ok in
the long run. Most of 'em do in fact blow up, but don't worry, we'll fix
it if you can get it to us, and it'll be done under warranty. And we'll
keep on fixing 'em as long as they keep blowing up. And we'd like to
thank you for spending your bux to be our beta-tester. We'll get it
right soon, don't worry. This is what is like with state of the art.
You've got the best car in the universe, even though yours doesn't run,
I can show you that others have had no problems. You will get there soon
-- keep the faith"

Now what's wrong with this picture???

... and the car is question travels faster than light, is small enough to fold up and store in your pocket, and did I mention the time travel capability?

Of course if you wanted reliability you could always use a horse (or a spark transmitter) :-)

This stuff if complex, if you buy a new car with a new design of engine you get problems. The only solution is to wait until they are on the mark II model. But if nobody buys the mark I then they won't make a mark II model.

Poor quality control, poor engineering but more importantly a rush to market are the problems these days. It ain't good but if you want reliability you have to wait.

Buying a leading edge radio has its downsides.

Just got my new txcvr and atas100. So far so good (on the bench.) I would appreciate hearing from any who have mounted the atas100 on a vehicle. I will probably put it in a pick-up and wonder how best to mount it....probably in a permanent fashion. It is a neat setup!

Hello group;
Recently, I placed an order on one FT100, delivered in august.
I just got a message from a friend of mine who says that the FT100 does not have mike input on the detachable front.
If that is the case, isn't that a drawback if you want to have the panel detached and mounted on the dash?

Alf

That's correct. The mic input is on the main unit. I find it an advantage personally as I can remove the front panel from the car without unplugging anything. My radio is mounted under the passenger seat, with the control panel on the dashboard.
FYI Yaesu do supply a suitable extension cable with the remote mounting kit. I didn't use mine but it is provided.

Cliff...

When we accept that 'new or complex' necessarily means unreliable, we are voting with our dollars for more products to come to market with major flaws. In the case of the 100, the manufacturer has been able to shift the responsibility for sloppy engineering and/or workmanship from himself to the customer (service techs are cheaper than engineers, I guess).

If we allow 'to market, and damn the customers' to prevail, we have only ourselves to blame. From my perspective, the list has served me well. I was inches away from forking over my bux for the 100. Seeing what this list has had to say, I've decided not to go in that direction. I don't think it's at all unrealistic to expect a radio to work as advertised, each and every time, and have a failure rate of less than 1/10 of 1% (one in a thousand).

Finally, although my original post did not contribute to the technical side of the debate, it did metaphorically speak to the 'how we got here' side.

Now, back to the basement to tune up that ford spark coil....

Hi Alf,
I thought it might be at first also. The remote mounting kit comes with an extension cable and a small mounting box for
the mike. I found that by using it I could mount my mike in a more convenient place. I have the control head mounted
just below the top of the dash on my Explorer. It is at a level that I don't have to turn my head from the road to see
it. The Mike connector is mounted on the side of center console next to the seat. This way the cord does not get in
the way of anything else on the dash board.

I also would agree with Mark. While it might be nice to have the option of connecting the mic to the control head or run separately, having only one way I'd opt for separate. I likewise have the front panel mounted on the dash (in my case between an air vent and the stereo) and have the mic connector mounted on the side of the console near my right leg. That keeps the mic cord out of the way of everything and I can just rest my arm on the arm rest and twiddle the up/down buttons on the top of the mic to scan up and down the band.

Jerome:
You need to remember that the number of postings indicating a problem with an FT-100 relative to the number saying they don't have a problem is not at all indicitive of the radio's failure rate. Just as you don't hear the evening news report all the people's houses that didn't get burglerized that day, you generally won't hear from the majority of the people who have not had a problem with their FT-100. If you panic when you see messages from a few 10's of people who've had a problem, then you've missed the whole point of this media.

> I don't think it's at all unrealistic to expect a radio to work as
> advertised, each and every time, and have a failure rate of less than
> 1/10 of 1% (one in a thousand).

There's hardly any manufactured products that have such a low failure rate, particularly ones that are as complex as the FT-100. If that's what you're waiting for, it's going to be a long time.
The fact is that while there have been some radios that have had some problems, mine included, the overwhelming majority here are very happy with their radio, including me. There has also been a fairly limited set of failures confined primarily to RF output problems, which means that the overwhelming majority of the radio has proven to be rock solid.
I used my IC706MKII this past weekend at Field Day and am even more convinced that I did the right thing putting the FT-100 in my truck.
Also, since I don't baby my truck and I certainly don't baby my radio, we'll soon see how reliable the thing is. So far though, it's worked flawlessly since it was returned from Yaesu (the original problem I had occured before I put it in the truck).

Hi Jerome

I can't speak for Mike's comments but I'm sure we all respect other people's comments and thoughts.

I agree that accepting that 'new or complex' means unreliable is not good. I definitely agree that voting for poor equipment with dollars (or Pounds in my case) is not good practice. However never forget we have a choice (as you point out below).

My point is that with the complexity of modern equipment, not just radios, something has to give in the struggle to reach the market in time and at the right price. For a product to be successful it *MUST* work but for it to be mature it must be sold and field tested. So here we have the dilemma: should we thoroughly test the product before release to market (yes I hope so but it might miss the market) or should we carry out sufficient testing to mathematically 'prove' suitability?

You would be interested to know that the best cellular phone manufacturers typically expect a 90% yield when the production line is ramped up. 10% failure is an appalling amount in number terms but acceptable in cost and time to market terms. Our FT-100s are made in minute quantities compared to cellular phones. I'd guess the R and D budget is much smaller as well. We then have the dilemma of whether we'd be prepared to pay say twice the price for a better unit.

Let's not forget that these radios are complex and small. I work in the cellular business with 6 layer PCBS, 0402 (2mm by 1mm) components and I know how difficult it is to make these things in quantity.

The other point you should remember is that the sample of problem radios reported by this list is totally unrepresentative of the total radios made. We really don't know whether the radio is a lemon or not I'm afraid.

My own initial radio was delivered DOA which is pathetic (I have a suspicion that it was a return). My next radio had a fault which was fixed and it seems fine now. I do however agree with the point about poor design. If the HF PA driver stage has been designed without due care to dissipation issues then that is inexcusable.

Finally I have it on good information that the use of spark sending apparatus, even for use in a maritime emergency, was only outlawed in about 1963.

Glad to know that you are hanging in there...

I'd avoid the Lakeview 4-mag mounts with SO-239 at all costs. The SO-239 portion of the mount is very poorly engineered and WILL positively come apart after a few removals of the ATAS. The poor engineering involves using RTV to hold a 'barrel-connector' into a housing which in turn has coax soldered to the bottom side of the 'barrel' There is NOTHING to keep the barrel from spinning.

Go to HomeBase, HomeDepot or an equivalent. They have all the parts you need for a price of less then $20. You'll need a 6ft piece of 1/4" x 1" alluminum(3 2ft sections to build an H), 4 4" or 5" mags, 8 sets of bolts, nuts and washers (1 set each mag and 2 sets at each end of the H)

For coax I'd recommend a prefab section with SO-239 from Comet (or similar) to mount in the center.

I've made 3 of these. 2 work perfectly on 40m-70cm; 1 had to be grounded to the vehicle for use on 40 meters (30meters was fine). Keep in mind thats more a function of the vehicle and its coupling then the mount.

Good Luck and 73,
Mike KF6SWI

Even Nasa does not expect to get a failure rate like that(1 in 1000). If
you did your $1200.00 radio would cost $5000.00
Most manufactures cut every possible corner to make as much product as
possible for the least amount of time and money. If the failure rate raises
above 6% they will slow production down just enough to achieve the
6% figure and they then party all the way to the bank with your money. I
make this comment from 15 years of experience with computer manufactures.

1119. Mount for ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-06-30 04:15:54 UTC
From: Jfering@xxx.xxx
Topic: 1119 Message: 1119

While I don't have the ATAS-100, I use Hustlers with the 54" mast. I have the mast mounted on a Lakeview mag mount with 4-4" mags of approximately the same configuration described by Michael Jones in his response to you -- except that the one I have was purchased some years ago and did not have an SO-239 on it. But believe me, you will be able to drive 80 MPH into a 50 MPH head wind and you will not tip the mags on the roof with the ATAS-100. I could not break them free under those conditions with three Hustlers (80, 40 and 20 Meters) mounted on the 54" mount in the upside down Christmas tree configuration. I had some 40 lb fishing line for guys but, unbeknownst to me, they broke and the whole thing stayed there. So I think you can depend on that mount, or the homebrew mount suggested by Michael Jones, to work well for you. I thought Michael's suggestion was very interesting. I was not aware all the components could be so easily purchased. I think that next time I need one I will do it his way.

By the way, I have had my FT-100 for about two months now and have used it quite a bit without any problems whatsoever. Great little radio! SN = 9E031371.

This thread is a waist of time. Why don't we discuss something more useful,
Like root cause? Why do these radio's fail? Could it be the design? Based on
what I've read here about the HF "fail to transmit problem" has accured after
the radio was turned off. Maybe a mod to keep the fan running after the radio
has been turned off could eliminate this problem. I'm no expert just a
thought. What do you think?
BTW mine has been working to spec for three months now and when its warm I
don't shut it off until it cools down. Even if it means going out to my
pickup to turn it off after I've parked it.

1121. Rig back from shop .. same problem!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-01 04:08:21 UTC
From: David O. Ausley
Topic: 1121 Message: 1121

Gave R.T. Systems a call this morning to check on my rig that I carried in for warranty service a week ago Monday and they replied "Oh yea, its ready" (Thought they were supposed to call me!) Anyway, I'm just venting....so I leave work this afternoon and drive like a bat the 70+ miles to try and get to their store before closing time. I arrive in time and ask for my radio which they place on the counter neatly packaged back in its little brown box. When I asked the inevitable question "What did you find?", the tech replied, "No problems, just out of alignment." Well I feel really stupid and he lets me mumble on about "Are you sure there were no burned up parts in there?!" His explanation was that it was probably a static electricity discharge or improper / poor grounding that caused the alignment menu settings to get out of kilter!!! Embarrassed, and like a dummy, I humbly and quietly take my rig home without further question and low and behold it does (or doesn't do in this case!) the same thing as it did before taking it in for service!!! Still little or no power output on HF frequencies! On CW, the output meter shows about 70 watts out on 10 meters, 50 watts out on 15 meters, 20 watts out on 20 and 40 meters, and little or no output on 80 and 160. These readings are all with the power setting at 100 % and into a good antenna or a 50 ohm dummy load. I feel really ticked at R.T.'s and now I'm not sure what to do. Should I burn another tank of gas and make a third trip back to argue with them, or just let UPS take it to Cerritos like I probably should have done 2 weeks ago?!

I appreciate all of the posts here and I know we're all in this together, so if anyone knows anything I can check or possible operator error please give your 2 cents. I haven't heard of this particular problem yet on the list, so maybe this is a new one to deal with. Here is a list of the things I have tried to eliminate op error:

*reset radio (both methods mentioned in manual)
*tried different antennas and dummy load
*tried different modes
*made sure HF output setting was at 100

Thanks for listening!

Well Dave I would just send it into Yaesu and tell them the story. They would have a better idea of what to look for in your radio than most of the techs that I have met that work in the stores.

Hi David, Are you sure you are using a good external power meter thats capable of covering all those freq.
If it were my rig, I would only have Yaesu work on it.
Good Luck, hope you find the problem.

I apologize for any inconvenience that our service department has caused. I would like to have the opportunity to correct the problem. If you will bring the radio back to the Huntsville store, I will reimburse you for the gas used to make the trip to Huntsville. I will also confirm the problem while you are in the store and make arrangements to ship the radio to Yaesu UPS Blue at our expense. I will also contact Yaesu and inform them that the radio is coming and try to get them to expedite the radio and return shipping.

Please call before beginning the trip and I will remain at the store until you arrive.

Topic: 1121 Message: 1125

Class! I have always said that if a retailer or service provider does not know about the problem, then they don't have a chance to fix it. One of the most valuable lessons that I ever learned when dealing with someone for goods and service that don't work out, is NEVER assume that they won't make an effort to fix the problem unless you give them a chance. I am not advocating calling anyone up and ranting at them, just let them know that you are not happy and see what they will do. I think that this response shows what may happen if the company providing the goods or service are informed. Most of the companies out there that are worth their salt will respond. For example:

I had an Alinco DX-70. This radio worked well and I had no complaints. I found out that at some point I stopped getting audio out of the external speaker plug. This radio made 3 trips to the factory with no problem found by them. After the last trip, the service manager there had promised to make it right, I called and asked him about this. Long story short, the service manager Doug got irate and impolite. I asked for his manager, Katsumi Nikata. He responded in the fashion that I expected. They paid for the shipping both ways, and I got a new radio. They said that the problem was an intermittent on the plug, but I know better. I will think twice about getting Alinco again.

The original FT-100 that I purchased was DOA. It acted like it was emitting a CW or AM carrier on all bands in all modes. I made about the same length of trip back to HRO in Denver and came out with a new radio. The second radio has been installed for about 3 months now and is still working as advertised.

Give the company that provides the goods or service a chance. It sounds like RT is making an effort to make good here and if I get the chance to do business with them, this will definitely influence my decision.

You bring up an interesting point. If the fan is runing I do not turn my rig off until I hear it stop. I wonder If this nervious habbit of mine has thus far saved me from a failure. I have never had anthing other than operator trouble with my FT100.

This thread is a waist of time. Why don't we discuss something more useful, Like root cause? Why do these radio's fail? Could it be the design? Based on what I've read here about the HF "fail to transmit problem" has accured after
the radio was turned off. Maybe a mod to keep the fan running after the radio
has been turned off could eliminate this problem. I'm no expert just a thought. What do you think?

Well, that was certainly an unexpected response. Quite refreshing in this day. It seems the good customer service of Yaesu rubs off on its dealers if not the competence of their service department.

I have used RT Systems before for service of Yaesu radios. I have always found them to be friendly and easy to do business with. For the record, I have not purchased radios from them, only because I have an HRO withing a short drive up this way.

I have also found their service department to be very good and competent. I am sure this is a case of mis-understanding or a disquised problem of some sort. Had they seen the problem I sure they would have fixed it.

Thomas...as I was reading your note, I went to the FT-100 and turned on my Sony ICF-SW33 and tuned them both the 7157 Khz. I moved the receiver about 100 feet away and my wife monitored the transmission. She heard me as I transmitted. I have not carried on a QSO, but this test is my only AM attempt. Dale KC2PZ

1135. Re: AM Transmit / lets try this again

Tom:
Yes, AM does work on the FT-100. My guess is (as I mentioned a bit ago)
that the person who did the review didn't have the radio adjusted
correctly for AM transmission. It's rated to transmit AM with a carier
power level of 25 Watts.

From: David O. Ausley
Topic: 1136 Message: 1136

After my "venting" post last night, I see we have a "silent" member of the group that I obviously have been unfair to. Rod's reply to my woeful message made me realize the power of the pen that we possess here on these mail lists and news groups! I have no desire to discredit a good business and I certainly want to be fair in my opinion of the service that they provide. (After all, my XYL and I bought 3 Yaesu radios from them in Dayton!) R.T.'s offer to make things right is fair enough and that's all any of us expect. We paid $1200 of our hard earned money to buy their product and we just want it to work like its supposed to. I plan to give R.T.'s another visit after the holiday weekend and see if we can get things straightened out. Thanks for your response, Rod. Glad to know you're keeping up with the plight of all of us FT100 pioneers.

Rod's post:
Subject:
RE: [FT100] Rig back from shop .. same problem!
Date:
Thu, 1 Jul 1999 08:19:12 -0500
From:

CC:
<dausley@...>

I apologize for any inconvenience that our service department has caused. I
would like to have the opportunity to correct the problem. If you will bring the radio back to the Huntsville store, I will reimburse you for the
gas used to make the trip to Huntsville. I will also confirm the problem
while you are in the store and make arrangements to ship the radio to Yaesu
UPS Blue at our expense. I will also contact Yaesu and inform them that the
radio is coming and try to get them to expedite the radio and return shipping.

Please call before beginning the trip and I will remain at the store until
you arrive.

Huh?
What AM problem? I can't find any problem with AM and to the best of my knowledge, nobody here has confirmed that they have a problem with AM.

Yes, there is an AM transmit problem on some models. Two of
my friends have earlier models that are completely garbled
on AM transmit. Yaesu has promised a "biasing" solution, but
none has materialized yet.

Rod:
This is real curious considering that the finals are out of necessity operating in a linear state or they would be useless for SSB. Do they still have those radios and if so what's the power output on AM?

From: vk6apk@xxx.xxx.xx
Topic: 1145 Message: 1145

Can anybody tell me if the FT-100 is able to key linear amplifiers without an interface. I have the radio on order and the next shipment is due in a couple of weeks. I just want to know if it requires an interface like the Alinco DX-70 and Icom IC-706. My amplifier is the Emtron DX-2 which has +ve keying with a 12V relay. Any help is appreciated. 73 de Alek, VK6APK.

>
Alek:

I have used the FT-100 to drive a QRO Technologies HF-2500DX quite successfully. What you need is an amplifier that provides a voltage source, which, when grounded, keys the amplifier on. In other words, when the FT-100 goes into transmit, the keying line from the amplifier is grounded, and the amplifier goes into transmit. According to the FT-100 manual, it uses a transistor "open collector" circuit which can handle amplifier relay coil voltages of up to +50 volts and current of up to 400 mA.

There is also negative voltage ALC, 0v. to -4v.

Both of these lines connect to the FT-100 via a single mini-stereo plug, like the kind used on walkman stereophones. All I needed was a "Radio Shack" adopter wire with a stereo plug on one end and two lines on the other end, each terminating in an RCA plug.

Hope that helps, Ray K1XV

1147. Re: Amplifier Keying

Thanks Ray,
My amp has +12V behind the relay and it draws 180mA when
operated so the FT-100 will handle it ok. Just like the FT-747 I had some
years ago.

Hi Chuck,

Yes they still have the radios and they were
adjusted properly for the power level. One friend
talked to Yaesu at the Seaside Hamconvention and
that's when the biasing solution was discussed.
Mine works ok on AM transmit, but it is very
sensitive to the mic gain level. I ordered mine at
Dayton and received it approx 2 weeks later. I don't
remember the sn right now.

Bill

"I have heard that the FT-100 doesn't work with any other microphones."

I have to question this statement. If you mean that you can't plug another microphone straight in then I'm not surprised but so what? Making an adapter is pretty easy.

Is it the pins outs that are wrong? If so you would need to wire up an adapter.
Is it the audio level? You would need to amplify or attenuate.
Is it the frequency response? You would need to tailor the response.

I have built my own mobile microphone circuit which I use all the time and it works fine.

The microphone supplied in the UK at least is a simple electret microphone. It's a real pain that they don't provide the necessary bias voltage (from the rig) on the audio input pin (like the IC706 does) but I can live with making a simple bias circuit.

It took me longer to knock the holes in the mic adapter box diecast box than to wire up the circuit.

Regarding the modulation quality: when I first went over to the FT-100 from the IC706 my father complained about the audio from the supplied fist mic. I played about with the levels and the DSP driven audio filters and improved it no end. When I connected my old boom mic up again (via the adapter mentioned above) he commented that the audio was excellent. These crude tests were carried out on FM, sideband and AM.

Group,

I have followed this list for many months now, and I am convinced that now is as good of a time as any to purchase my new FT-100.

I contacted Yaesu "technical support" about the FT-100 last week. They told me that they were not planning a production run that would correct the "PA problem". They did indicate to me that they have learned that several of the FT-100's that they received for "warranty repair" did in fact have damage that was caused by the user. Several instances related to having poor "grounding" provisions for the FT-100.

I recently sold my FT-847 and kept the ATAS-100 antenna with the optional base kit (counterpoise). I am purchasing the FT-100 as I primarily need a HF mobile rig, due to the fact that I live in a deed restricted area.

I have a few questions that I would like to present to the group.

1. What dealer has the "best price" on the FT-100 and shipping at this time.

2. Since I came out of an FT-847 and have optional microphone accessories for it, specifically the "Heil HM-10", have you seen a microphone connector adapter that will allow me to convert from the 847 microphone connector to the FT-100 phone plug microphone connector.

3. I have a Comet CFX-514 triplexer that I used with my FT-847. I am to also understand that the FT-100 has two antenna ports on the rear: one for HF/6, the other for 2m/440. What is the best way to adapt my triplexer, and or what diplexer would you recommend for the FT-100.

I hope you are all enjoying a safe and great 4th of July weekend.

Happy DX'ing.

Hi Joe

"I contacted Yaesu "technical support" about the FT-100 last week. They told me that they were not planning a production run that would correct the "PA problem". They did indicate to me that they have learned that several of the FT-100's that they received for "warranty repair" did in fact have damage that was caused by the user. Several instances related to having poor "grounding" provisions for the FT-100."

Well guys, this is a red flag to a bull! If this statement is indeed true I shall never buy Yaesu again. Considering the radio is designed for the amateur market and that over the last 20 years amateur licence technical exam standard have dropped to the point where they have almost disappeared then the Yaesu design must be very poor indeed.

I'd like to know how the driver stage of a PA can blow up if the output is open circuit? The finals maybe, but the driver I don't think so.

I've got to say that we aren't having a good July 4th in the UK! :-(

Have a great time over there :-)

Cliff, G4PZK

From: David O. Ausley
Topic: 1152 Message: 1152

Joe,
Did Yaesu tech support elaboriate any on what type of grounding errors these people were guilty of? Maybe this is my problem, but I am using basically the same mobile set up for the FT100 as I have for years with my old TS-140 which operated flawlessly. I'm sure that most any mobile installation can be improved by additional grounding, but how much is enough and speciffically what is needed to protect the radio itself? As long as the SWR and impedance match are good, the radio should be happy.

I am headed back to RT Systems today to return my FT for the second time. (Ref: posts from last week) I will see what other information they have to offer on the subject.

Joe,
I enjoyed our telephone conversation last week, however it appears that some of our conversation was "lost in translation" to the posting here on Onelist.
We are not planning to redesign the FT-100 into a "new version" (your original question) - however saying that we are "not planning a production run that (will) correct the PA problem" is way off base. Yaesu is very concerned about the premature failures that some FT-100 owners have experienced. As a result, we have implemented updates in current production runs to prevent future issues, including the "PA problem" you refer to. "Grounding provisions" have not been a problem with the FT-100, and have not contributed to any FT-100 failures that I'm aware of. As I'm sure many on the list can verify, the ATAS-100 antenna / FT-100 combination requires a very solid grounding and counterpoise system for proper tuning on all bands (40m~70cm). As a result, we have recently released the ATBK-100 antenna base kit for base station use and are currently working on an FAQ/Tips sheet for installation of the ATAS-100 in the mobile environment as well. When complete, this information will be available at www.yaesu.com.
Now is a great time to purchase an FT-100. I'm sure you will enjoy the rig and it's many unique features. As always, feel free to call me or send email to my work address (yaesutech@...) if you have any questions.

Thanks Mike.

Guys, I didn't say anything about this but now that Mike has made a post,
his secret is out.

When my FT-100 failed a second time I immediately broadcast to the FT-100
list and the next morning, I called Yaesu. Mike answered the phone and
greeted me by name, saying he read my post on this list and was expecting
my call. Soooo... someone who cares *IS* listening at Yaesu. That's very
refreshing to see.

Mike did everything possible to make sure my radio was repaired quickly
and shipped out so that I could have it by the holiday weekend. I told
the list that I had "diagnosed" that the LPF assembly had a mechanical
fault and requested that the board be replaced - right or wrong, that's
exactly what Yaesu did. The radio worked fine over the holiday on all
bands that I tried (20, 6, 2, and 440).

1157. Tuning knob adfjustment

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-06 02:28:45 UTC
From: kf6djl@xxx.xxx
Topic: 1157 Message: 1157

Hi guys
Just got mine back from Cerritos.
They said that they "replaced defective parts on P.A.Unit tested all functions and aligned unit to specs."
During the VHF-UHF contest on saturday afternoon I lost output on all bands, & got VERY Hot on left rear of unit in receive.
Serial # 9e032128
Anyway, I removed the tuning knob & found a small amount of adjustment for drag.
Remove the rubber cover by prying from the rear. (no glue).
Loosen set screw (1.5 metric allen) & remove knob.
In the recess you will see a spring wrapped radialy around the shaft bushing with tail sticking out lateraly at the lower end.
Turn with a probe clockwise for more drag, counter for less drag. (less drag makes it feel like a heavier knob, but might harder to control mobile)

BTW I use mine in my 18 wheeler & Yaesu said nothing about the mod. to transmit on 11 meters.
Also I've found AM sounds best w\ power out in the midrange, mic gain in the mid 60 range & compression around 25-30.

73, Dan

1158. Rig back in service!

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-06 05:11:48 UTC
From: David O. Ausley
Topic: 1158 Message: 1158

Well, I'm back on the HF bands with the FT100 once again! Trying not to get to excited and keep my fingers crossed that things are finally corrected and the rig is going to be everthing that we all want them to be. If you remember, last week I picked up my rig after 9 days in RT System's shop with the same problem as when I brought it in. (No HF power output) After expressing my disappointment here on the group, the following reply was received:

>I apologize for any inconvenience that our service department has caused. I
>would like to have the opportunity to correct the problem. If you will

>bring the radio back to the Huntsville store, I will reimburse you for the
>gas used to make the trip to Huntsville. I will also confirm the problem
>while you are in the store and make arrangements to ship the radio to Yaesu
>UPS Blue at our expense. I will also contact Yaesu and inform them that the
>radio is coming and try to get them to expedite the radio and return
>shipping.

>Please call before beginning the trip and I will remain at the store until
>you arrive.

>Rod
>RT Systems Amatuer Radio Supply
>8207 Stephanie Dr
>Huntsville AL
>Sales 1-800-723-6922 1-256-882-9292
>Tech 1-256-880-3093

Well, I spent the morning taking Rod up on his offer and was pleasantly surprised when he personally took my radio back into their shop and verified that my problem did exist, replaced the PA board while I waited, and then invited me to check it out on the air at their demo operating position before leaving their store. Everything checked out fine with 100 watts output indicated on all HF bands. I really appreciate this kind of service and would recommend RT's to anyone out there considering purchasing ham gear by mail-order or locally in the North Alabama area. (Even if he didn't actually offer to buy my gas...hi hi)

Hopefully we can get these kinds of experiences behind us and get on with discussing all the great features of these little radios and how to get them to do all of their tricks! Speaking of which, I would like to know more about what types of additional grounding everyone might be using, especially mobile. I am using a bumper-mounted Hustler antenna system on a Ford Ranger pickup and it seems to work fine, but wonder if noticable improvements could be realized by adding additional bonding jumpers from frame to chassis, etc. ??

73's and see ya'll on the air once again!

I have mine mounted ont eh trunk with a diamond 400 mount. I was having the occassional swr problem, and in addition to replacing a cable, also ran a copper wire from the trunk to the body of the vehicle. This does seem to improve both transmission and reception. It wasn't bad to do- there was actually holes already in the trunk lid bracket and the body on a 1985 ford tbird.

Like many of you folks, I was concerned with the pigtails coming out of the Ft-100. Being conservative, I decided I didn't need that one cable used for I/O because I use the rig mobile and without the ATAS-100.

So, I simply opened the case and unplugged it. It's in the box in case I ever need to use it, but for now, it's safe and sound and I'm not worried about slicing it off or otherwise breaking it.

The radio's been to Yaesu twice and they don't seem to care. If you don't use that cable, I'd suggest you do the same.

From: WW4WJD@xxxxx.xxxxxxxxxxxxxxx)
Topic: 1163 Message: 1163

Group,

Do you know what I don't like?

Contacting Yaesu Technical Support by telephone, asking some intelligent and much needed questions about the FT-100, and documenting the telephone conversation by meticullous note taking... Then, reading my daily digest of FT-100@onelist.com to see the answers to my questions (by telephone) "twisted" around to the point that lies are placed on this mail list.

I would like to respond in defense of my original post and put this issue to rest.

According to my notes from last weeks telephone conversation with Mr. Mike Krueger:

I asked Yeasu Technical Support (Mr. Mike Krueger) specifically if any corrections would be made to the "current or near future" FT-100 production run to fix the PA Problem. The answer I was given was "no". Reason: the failure rate of the FT-100 was extremely low and Yeasu had not been able to determine what specifically was causing the PA Problem.

It was stated by Mr. Krueger in conversation that several of the FT-100's that were returned for "warranty repair" were in fact damaged by the customer due to improper operation and grounding concerns involving other manufacturers antenna's. as well as the ATAS.

Folks, I know that what I was kindly told on the telephone and what I read by Mr. Krueger post on this list were directly opposing responses.

It's bad enough that this kind of situation takes place in the White House, but what an amateur manufacturer shares in the form of information via telephone, should directly correlate to what is said on an electronic mail list.

Now, that I have defended my original "factual post", would someone be so kind to view my attached e-mail (original post) and assist in answering my three original questions...

Best Regards,

Joe Mattern, WW4WJD

I have corresponded with Mike from Yaesu on several occasions concerning my Ft-100 as well as my FT-847.

I have found his answers to be helpful and generally easy to understand.

He always seems to try to be understanding and give good advice.

I would put him in the category of trying to do a good job in an area, tech-supt, where people's expectations are usually larger than "mere mortals" can hope to fulfill.

In case anyone gets the idea that I am a Yaesu zealot, I also own an IC-756 and even have owned Kenwood radios before.

Subject: [FT100] A simple Mod...

From: "Paul R. Valko" <prvalko@...>

Like many of you folks, I was concerned with the pigtails coming out of
the Ft-100. Being conservative, I decided I didn't need that one cable
used for I/O because I use the rig mobile and without the ATAS-100.

So, I simply opened the case and unplugged it. It's in the box in case I
ever need to use it, but for now, it's safe and sound and I'm not worried
about slicing it off or otherwise breaking it.

The radio's been to Yaesu twice and they don't seem to care. If you don't
use that cable, I'd suggest you do the same.

I'd say that all our rigs are fixed and everyone is too bizy usin' 'em!

Made my first FT-100 to FT-100 QSO yesterday with a guy in NY. I was his third QSO as he's just got it a couple hours beforehand.

Geez... I HATE the noise my 97 Grand Prix makes on 40M... makes the band almost worthless. I had the same problem with the FT-900 too. I think it's the fuel pump - man, does it radiate RF on 7MHz! You'd think these car companies would have this stuff under control by now.

1170. fuel pump noise and Yaesu backlog

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-09 15:14:48 UTC
From: Pres Waterman
Topic: 1170 Message: 1170

PAUL>Geez... I HATE the noise my 97 Grand Prix makes on 40M... makes the band
almost worthless. I had the same problem with the FT-900 too. I think it's the fuel pump - man, does it radiate RF on 7MHz! You'd think these car companies would have this stuff under control by now.

PRES>Why, Paul? <G>

BTW, Ford has a nifty little white filter that is designed to be mounted inside the fuel tank, inline with the power leads of the fuel pump. But, being a dealer and changing cars often, I couldn't be bothered spending the time and money to drop the tanks to install them, so I put it in the power leads of my Kenwood TM-741 and it worked like magic. (The fuel-pump noise was aggrevating in the AM-Aircraft band).

The way you can tell is this: stop the engine, turn the radio on if you can, and turn the key to the "run" position without cranking. If there is a nasty whine for a second or so that stops, you're a winner!

F1PZ-18B925-A is the number as I recall, and my dealership can source them if you like.

Pres Waterman W2PW
c/o Patchogue Motors, Inc.
Long Island Ford and Kia dealer

GO BILLS!

BTW: I sent in a FT-767 for CPL repair and their backlog is 6-8 weeks. They seem to put warranty ahead of customer-pay, which could be nice depending on which side of the fence you are on!

(The number of seconds in "a minute" is directly proportional to which side of the bathroom door you are on!)

Gosh Pres, what happens to that filter if you pull 22 amps through it for
an ft-100? Poof?

> The way you can tell is this: stop the engine, turn the radio on if you can,
> and turn the key to the "run" position without cranking. If there is a nasty

Mine does that except it NEVER stops. I would think the fuel pump would
run all the time, unless there's some back pressure switch on it.

> F1PZ-18B925-A is the number as I recall, and my dealership can source them
> if you like.

That's very cool... I'd be quite interested to know how it would deal

1172. FT100 HF & 6M PA problem.

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-09 22:19:26 UTC
From: Matthew Beasant
Topic: 1172 Message: 1172

Dear List,

My FT100 has developed a fault & I was wondering if anyone else on the list has any experience of this fault.

Apologies if this has already been discussed but I've had the rig for about 2 weeks and I've just joined the list.

I was working on 6m, mobile with a Pro-Am 6m whip mag-mounted on the roof of the vehicle. Output power was about 60W at the start of the QSO but after a few overs the PO meter on the FT100 had dropped significantly. I reached to where the transceiver is mounted to feel the temperature. The heatsink was hot, but not so hot that I couldn't keep my hand on it. I quickly signed off the QSO and stopped to check the antenna & measure the RF output. I measured (into a 50R Load) 15W on 6m, 6W on 10m and zero on all other bands. 144/430MHz is unaffected. The antenna was presenting a 1.2:1 VSWR on 51.49MHz where I was operating.

I tried increasing the RF output power via the menu but with no effect. I also re-initialised the rig just in case I had any crazy menu settings! Still no good.

The supplying dealer (Lowe in Bristol) has responded admirably by letting me swap the FT100 for another one but I'm worried that the same may happen again.

Anyone on the list with similar experiences?

Thanks,

Matt Beasant

Hi Matthew.

I'm sorry to say that this is a rather classic fault. I had exactly the same problem, different dealer. They had to replace some circuitry around the pre driver transistor. I was fortunate that the transistor itself hadn't blown up. It was repaired in about 3 days with no fuss and the radio has been OK ever since.

What puzzles me about this is taht if you run off a battery, you will also get thenoise. My fuel pump noise is radiated, not power related. I am most curious that it went away by inserting the filter in the power leads to the radio. Now, I know that some Fords have the problem and some do not. Any thoughts?

BTW, I would be interested (by direct email) in the price of the filter from your dealership.

Thanks,

Tom

Is it possible that the positive +12vdc wire to the Fuel Pump is radiating
as a antenna?
Think about the way a spark gap transmitter worked!
Now what happens if you put a rf choke in series or bypassing to ground
circuit at the pump?
If a DC motor with brushes is sparking I would think the correct value of
capacitor at the motor would clamp most of the spikes. I think most motors
on automobile now days has caps on every motor.

From: Paul N. Lawrence
Topic: 1170 Message: 1182

My last Ford was a van (my previous Mercury Crown Victoria did the same) and had so much RF noise that I couldn't use 2M without a
high squelch setting.

Now, I notice Fords by the squelch breaking noise as I drive by them on the road. I can be at least 75% correct in guessing the
brand if I just say "Ford!" Other cars do it, too, but not as many as Fords. Of course, its the newer models.

I've always attributed it to the computer system, because it wasn't in my old model Mercury Crown Vic. It was added with the newer
body style of a few years back, and then the newer van had it, too.

Go figer.

You know, I never thought this through, I guess the EEC system shuts it off after a few seconds if the engine fails to start, at least in Fords

Yeah, I thought of that. But I think the Kenwood draws over 15A, almost as much as the FT-100.

Tell ya what. IF I have the problem when I install the 100 and solve it with the 18B925 I'll let the list know. But you should try it since you have the issue now. Good luck, they shouldn't be too expensive.

Paul,
Good idea!
Sounds as if your computer and or it's wiring are the problem.
There is a closed loop system that fires up when you turn the key to the point gauge lights come on.
I would suggest you make a sniffer!
A little tuned coil/ capacitor circuit on the end of a shielded feedline.
It should be tuned to one of the offending frequencies.
It should be connected to a battery operated receiver.
If you are lucky and find the offending source then ferrite beads and or toroids of correct permeability
will be needed to CHOKE the signal close to the source.
This is not a easy task. If you are determined, maybe a chat with Gary Kaufman would help.

Best of luck to you,

Jack

There was a recall on Fords for fuel pump RFI. You may ant to check with
your dealer.

Subject: RE: [FT100] fuel pump noise and Yaesu backlog
Importance: High

From: "Paul N. Lawrence" <n5tns@...>

My last Ford was a van (my previous Mercury Crown Victoria did the same)
and had so much RF noise that I couldn't use 2M without a
high squelch setting.

Now, I notice Fords by the squelch breaking noise as I drive by them on
the road. I can be at least 75% correct in guessing the
brand if I just say "Ford!" Other cars do it, too, but not as many as
Fords. Of course, its the newer models.

I've always attributed it to the computer system, because it wasn't in
my old model Mercury Crown Vic. It was added with the newer
body style of a few years back, and then the newer van had it, too.

Go figer.

Tom is 100% right. I checked this out on my Gradn Prix several weeks
back and even have a witness.

The noise I get, is RF.

I absolutely agree with you. It makes no sense. I have even stood at Dayton with the Ford engineers at their booth and we both marveled at how it shouldn't work. We then discussed how bumblebees can't fly either.

1188. dsp noise reduction

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-16 04:54:58 UTC
From: William Mastop
Topic: 1188 Message: 1188

This may seem a little dumb, but I"m having trouble understanding the tip at page 45 of the manual for my ft100, and thought perhaps someone else had tested this. Under the dsp noise reduction section, the manual says "if noise is present at a level which causes indication on the s-meter, the performance of the noise reduction filter may be enhanced by rotating teh sql/rf control in a counter clockwise direction so as to set the (fixed) S-meter reading at the same level as the noise peaks. This adjustment raises the AGC threshold of the receiver." As I say, this may sound stupid, but what the heck does this mean? Do I use menu 56 to change the function to rf gain? If I do so, when turnign the knob, will I see the s-meter move, until it is equal to the usual noise?

Another question, one of our repeaters seems to be on a troublesome frequency for me. If I set the squelch at a certain level, such that nothing breaks through except a fairly strong signal, and then have the unit scan the stations in memory, when it gets to this particular frequency (145.410), there is enough noise to break through the squelch. Then I have to adjust the squelch higher, and as a result, miss slightly weaker calls on the other frequencies. MY scanner has no such trouble, but the radio sure does. Any idea what is going on with this? I tried turning the squelch right off, and then tuning manually right around the frequency, and I find that if I get go to 145.420 or .425 the noise disappears, and the same in the other direction.
Any ideas would be appreciated.
William (VE7WJM)

By any chance does have all your tests been at the same location? If so you might try moveing somewhere else and trying again.

I have found that my DVD play emits a pulsing carrier at 145.015. As a result, I was having a similar problem with my FT-847. I chased it down with an HT and confirmed by unplugging the offender. It was stubborn too, it didn't go away for a good 30 seconds.

The odd thing about the whole carrier is that it seems to increase and decrease in power. Sometimes I don't get any reading on my 847; but its always there on an HT in the house. Other times its about S5 on the peaks while connected to an Omni Vertical at 30ft nearly directly above the unit. Also, it seems to be vertically polarized too, I never hear anything on a horizontal beam on the same mast.

73,
Mike

I am having a swr problem if I have two antenna hook up to my ft100 radio I can not tune the atas 100 ant it will show a high swr on the upper bands. so I remove one ant. and use a duplexer the problem went away but the loss with duplexer is high 8 watts loss on 440 side 4 watts loss on 2 meter side. I wood like to run two ant. I am getting ref power off each antenna is they any way to get around this the ant are about 5 feet apart.

Hi,
I appreciated your message. Mine does the same, and is annoying because it stops the scanner for no reason. I have gotten around it my setting up my memory with most possible frequencies in the area, and I scan only the memory.
Your problem is likely not proximity to a noise source, since it happened to me in Arizona, Utah, etc. But it may be proximity to a noise source generated by the car that it is in. Mine is a Chrysler Town and Country Minivan.
I'm sending this message this way because I haven't figured out yet how to send a reply to a message of a previous day.

1193. RE: False signal on 145.410

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-17 20:36:58 UTC
From: Cliff Bryant
Topic: 1191 Message: 1193

I've got a suspicion that the problem is simply an in band sprog. I get a massive carrier on 433.4125 (I don't use it fortunately) I also get a weak carrier on 145.4125 which I also usually don't use. The only cure would be for the radio to be redesigned or for the synthesisers to move to difference frequencies to avoid in band signals. The same technique is applied in cellular technology. I have to say that my IC706 never had any problems with in band signals, although the prototype that Yaesu demonstrated 4 years ago at a major UK radio rally had loads of in band sprogs. Over all the sprog situation is acceptable to me but not good if one took a purest view of the design. Cliff -----Original Message----- From: r_buiten@... >William (VE7WJM)

Aha! So it's not just me! I too have noticed this problem -- I
programmed a local repeater on 145.41 into a memory, and the memory
scan would always stop on that channel. I wouldn't call it "noise"
exactly; it's almost like there's a weak carrier on that frequency
(with no audio). If the repeater comes up, it overrides the
"carrier" and I can hear the QSO fine; but when it's over, instead of
hearing the squelch break, it goes back to this "noise"/"carrier".

Anyone else with this problem? Can anything be done about it?

1196. ATAS-100 with ATBK-100 Antenna Base Kit and FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-25 17:30:44 UTC
From: Robert Longoria
Topic: 1196 Message: 1196

I was hoping that someone on the list might give me some advise about a problem that I am having. I have an FT-100 hooked up to an ATAS-100/ATBK-100 Base Kit. The antenna is on a pole that sits right above the roof. In operating on 20 meters, the antenna tunes fine and I get the SWR-OK Icon. However, when I transmit, the SWR-High Icon keeps showing on the front panel. I am concerned about this problem and would like to fix it. Anyone have any potential solutions? Any help would be greatly appreciated.

Tnx,

Bob

Bob....you might try a ferrite donut just under the antenna mounting
kit....wrap three or four turns of coax through the donut (2 or 3 inch
dia.) This worked on my set-up when I got a swr-x reading...Dale KC2PZ

Bear in mind that the ATBK-100 kit is NOT intended for HF counterpoise use
and is just intended for the UHF/VHF stuff. I would suggest that you add
radials.

All-
Likewise with mine. I thought this might be a local(?) noise source,'
or a packet freq. A birdie, or synthesizer by-product, makes more
sense. Just enough signal to trip the squelch with static. And too much
signal to block by turning up the squelch without blocking most other
repeaters as well. We do have a local machine on 145.410 but this seems
to be from a different source. Also it seems to be unrelated to the
vehicle.

Just a guess here, but I have the same trubs on 145.25 MHZ and have
it tracked down to the local cable tv service...Could it be this that
your experiencing also??? Just a long shot,

Yeah, mine neither. Serial number 9DO22161.

That part of 2m is unused here in Australia so it wouldn't matter anyway.
Our repeaters ar between 146.625 and 147.375.

Another thing, here we get the MH-42b microphone supplied with the radio.
It does not have the number keypad on it. Maybe it has to do with the mic
you get in the states. I don't know.

The darn thing drives me a bit crazy here. 145.41 is one of our busiest repeaters- it's the long range connect to numerous other repeaters, so I do find it most annoying.
Anyone have any ideas for a fix?
And to the guy in Australia, how the heck do you use an autopatch without a numbered keypad? Ouch!

Anyone from Yaesu out there have any comments on the birdie at 145.410 in earlier models??? Although it is no problem for me at this time, it is there (it appears at 145.407.5 on USB and LSB and CW on my rig) and it is good to know about it. My SN = 9E031371.

K9BDN, Eau Claire, WI

1209. Receiver problem

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-20 06:35:55 UTC
From: dosborne@xxxxxxxx.xxx
Topic: 1209 Message: 1209

Hello to the group.

The receiver of my FT-100 seems to only work when set to FM (WFM or NFM) mode and will do so on any band. When the mode is switched to a1 or a3 the receiver is quiet except for the very, very faintest of noise when the squelch is rotated ccw. There is no s meter indication. The only acknowledgment of an external signal (in the cw an ssb, but still nought in the am mode setting) occurs when it is tuned to a very strong fm broadcast station (96.X MHz) with the squelch set sufficiently low. When this is done ones ears can just discern an increase in the static level occurring whenan antenna is connected. I have reset the unit and rechecked my settings to no avail. The unit was purchased new exactly one week ago and was used only as a base station receiver. Any ideas? and does anyone have an effective phone number for yaesu. Thanks

Regards
Derek

Hello Michael

Three times!. Were they able to concretely ascertain the cause?.

My manual and warranty card gives snail mail addresses but do not seem to give phone or e-mail info for yaesu. When the sun rises I will call the dealer for this info.

Thanks for the reply
Derek

Well, I only live about 90 miles from Yaesu (cakewalk of a drive here in SoCal) so turn around is about as good as possible. First failure 11 hours appx out of the box. Repaired 2 days later, failed again 2 weeks later. Repaired 2 days later, failed about 2 weeks later. They've since come out with a 'mod' that supposedly soolves the problem, but unfortunately, I have had it back in for the 3rd repair yet. The list will know come good or ill what happens. ----- Original Message ----- From: Derek Osborne To: Sent: Tuesday, July 20, 1999 12:32 AM Subject: Re: [FT100] Receiver problem > From: Derek Osborne > > Hello Michael > > Three times!. Box it up. Send it back. That's what went wrong with mine. They will
replave about $11 worth of parts and it will be fine.

Make sure you send the Serial Number to the list here to add it to our
collection.

Thank you all for your responses.

I had it boxed to sent to Yaesu but the dealer KJIelectronics of New Jersey is quite willing to replace it. The owner Gene thinks that the replacement machine will be of the same generation as the old which begs the obvious question and leaves me tempted to send the rig to Yaesu for repair and mods (Keep us posted Michael). But I'll probably play Russian roulette with a new one.

The serial number of the unit is 9E031245. Where can I find the compilation of sad serial numbers?.

From: dosborne@xxxxxxxx.xxx
Topic: 1218 Message: 1218

If This is the wrong forum for these questions please issue a sharp rebuke then point me in the right direction.

I (David without a slingshot) am about to approach my landlord (Orwellian Goliath) about an antenna presence on the roof (up 18 floors rimmed with metal railing). I m contingency planning down to last resorts, i.e. ..... (99)feeding a small innocuous whip (atas-100) mounted on the railing , (100) feeding the railing itself.

A few questions Concerning the atas
0) any issues with the FT-100 and the atas
1) Even up 150? is a 1.6m max length antenna even worth it for mostly (40, 20,10)m
2)Any control issues with the +- 60? of cable needed to reach it with or without an in line LPF should I decide to use it only on HF.
3)How weather sensitive is it particularly with respect to water and ICE
4) What is it?s wind rating (does Yaesu rate this it for the autobahn)
5) Is it very high maintained
I am wondering if it might be cheaper just to load a whip or the railing with an waterproof automatic antenna tuner though I seriously doubt that any I can afford can handle the likely impedance range.

Thanks for any thought on the matter.

Derek

With the location being that high, you might do better to install a dipole as long as they will allow for flat top length, feed it with twin lead or ladder line, and kick some butt. Even if they will only allow you to suspend the dipole 10 feet off of the roof, it will work better than the ATAS100, even on the lower bands. Having said that, I have mounted my ATAS100 on the luggage rack of my 5th wheel camper, fed it with 50 feet of coax, and with radials attached for 20 and 40 meters, it tunes up just fine and I have made in state contacts on 40 CW running less than 5 watts. Just my thoughts!

Tempting thought, but foolish. I would be far more comfortable sending it
back to Yaesu to get all the little mods we don't even know about
installed.

I sent my Ft-847 back in for service just before the warranty expired and
had all the "updates" done to it, FREE.

As far as my FT-100 goes, it has been working perfectly since it was fixed
and it is a fantastic rig.

I have found the ATAS to be an excellant antenna. I have tried several over the last few years and the ATAS is th e best by a wide margin. I have been able to work into Europe with no problem on 15, 17 & 20.

I recently worked 3 Japanese stations on 17M, one of which was also mobile.

I have also used in on 40M for several contacts although I do not spend much time on 40.

So even though it is small it seems to do a very good job.

It's true except the frequency was 1800 dead I believe. All the ones the dealer bought from were changed by Yaesu. If you went to a main dealer now you'd be alright.

According to the dealer and some of the guys on here the change is a new microcontroller, not very subtle but there we have it.

From: Cliff Bryant
Topic: 1230 Message: 1230

Following on from the 145.4125 carrier I have a massive birdie (Eagle?) on 433.1625, as in 59 +20.
Anyone else got problems here? In the UK this is technically a 70cm repeater channel although it's not used to my knowledge. The signal does stuff 433.150 quite badly.

Cliff, G4PZK

1231. Noise Blanker and 433 MHz

From: Alek Petkovic
Topic: 1231 Message: 1231

Yep, I fell deeply in love with the radio the moment I switched the noise blanker on whilst in the car. It's the best I've ever had.

To Cliff, G4PZK who has the big one on 433.1625, there's not a sign of anything in that region in my radio nor is there anything on the 2m frequency. That's am, fm, cw or ssb.

I've got plenty of power line noise but no birdies siting on them. Hi.

73 from sunny Perth,
Alek. VK6APK.

From: Dan Baker
Topic: 1235 Message: 1235

So when is the best time to buy a FT100?
When there is a 100.00 off coupon, a free filter,ant,tuner, or somthing of
the
sort. Yes as a good Amercian I need a freebie. I might have to wait for
Icom to do the same with there 706g to challange them but I am willing.
Maybe they could have a deal like buy the first FT100 at regular price and
get the second one for just one penny. Well maybe that only works with
cheeseburgers. Anyway, Yaesu do somthing so I can buy two.

1237. Dead ATAS???

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-22 17:10:22 UTC
From: Mike & Kristie
Topic: 1237 Message: 1237

Has anybody had problems with the ATAS. It worked great for about three months and now it won't tune. The radio says that it is tuning, and it TX for a lot longer than it used to. It looks like the antenna extends maybe a 1/4 to 1/2" then it retracts. Also, it doesn't make noise like it used to, you can't hear the motor. Is there any way to check to see if it's the radio or the antenna. I've already talked to Texas Towers, where I bought it, and all they said is ship it back. I'd like to know for sure that it is the antenna. Any ideas, hints, or comments would be greatly appreciated.

From: John Woika
Topic: 1237 Message: 1238

Mike, good afternoon, I have an ATAS100 that for some reason would not tune 40 meters. I looked and studied the whole situation. Mike, Has anyone played with the position of the rubber accordion boot? Mine was pulled down to low and the motor clutch would not allow the extra pressure to expand the whole boot. Once I pushed it up on the shaft about 1 1/2" the antenna seemed to tune OK on forty. I use 6 meters as the last band operated everyday to shrink the antenna back down so I can store it in the trunk.
"Make" sure you have a clean 'positive' connection to ground,through the mounting bracket and the car body. Also connect a good metallic ground strap from the side of the FT100 or back of the FT847 to the car/truck floor.

Good luck,
73s de John W8JW

From: John in Roseville
Topic: 1239 Message: 1239

Serial #9D021042 was sent to Yaesu twice for the same problem
and still not fixed!!!

Now I'm going to return it to Texas Towers for a refund.

The problem is with the 70cm FM transmit. The bad SWR icon
comes on and it doesn't transmit.
It does this with an antenna with a Bird wattmeter inline and the
antenna has a swr of 1.1 to 1. It also does this with a dummy load
that has a swr of almost 1 to 1.

John in Roseville N6ZJB

Apply between 7-9 and 11-14 volts to the coax center positive and ground to
gound. This should make the antenna extend and retract...

1241. Noisy Lincoln

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-23 00:39:36 UTC
From: Lamar Brown
Topic: 1241 Message: 1241

To the Gentleman with the FT100 in his Lincoln:

I too have my FT100 installed in a 99 Lincoln Town Car.
I just returned from a two week vacation in which I used the radio and the ATAS-100 on all bands from 40 meters
to 70 cm. The following are my observations;
1. I had no birdie on 145.41, My s/n is 9E031xxx. (Has been returned to Yaesu once for repair and upgrade).

2. I did however experience other birdies on other frequencies. I found that these birdies were caused by my
Cellular phone mounted in the car. If the phone was turned off, the receiver was quite on 2 meters and 70 cm.

3. The ATAS-100 antenna did very well I thought on 40-10 meters. On 17 meters I did have to resort to manual tuning, but
was able to get a low SWR. This I see as normal.

4. Using the ATAS-100 on 2 m and 70 cm will work but the range is not as great as the Diamond NR770HB that I use.

5.The only time that I had to use the Noise Blanker (which works GREAT) was when on AM or around power lines/cars. Over all this is a great little radio.

The radio is mounted in the trunk with a #6 stranded wire feeding 12 volts to it. The radio is grounded through
the mounting bracket and another #6 wire to the frame. The trunk lid has a ground wire to the frame. With this
arrangement I have been able to xmit for a period of time with out having the motor running.

I was thinking that if you have a Cell phone that it may be part of the problem.
Anyway, hope you find the problem and are able to enjoy the rig.

I had the same problem, before I returned mine a second time, I opened it
up to diagnose it myself (I used to do that for a living before I
got out of college and into computer networks) I digress...

The problem I found was a mechanical defect in the LPF board. I asked
Yaesu to REPLACE - not "repair" - the board and it works just dandy.

Lamar......thanks for your observations on the Lincoln, FT-100 and ATAS-100. Mine is a '95 Mark VIII. I have the body of the radio on the floor behind the passenger seat. The face is mounted on a stalk bolted into the bottom of the console and protruding up 6 inches. While resting my arm on the console, I can comfortably punch all the buttons and turn the knobs. I already had a FT-8100 in the car with a Larson dual-bander and trunk-lip mount, so I use the ATAS-100 for HF and 6 mtrs. The separation kit was troublesome to begin with. I tried all the grounding and still it would not tune the ATAS-100. I then installed a ferrite donut on the coax under the ATAS-100 homemade bumper mount and it fixed the problem. I currently do not have the radio body separately grounded, and it works fine. I have no birdies. The noise blanker is superb. It takes out static crashes, ignition noise, and high background white-noise. When adjacent big-signals are present, you have to turn off the noise blanker to stop the spatter, however. The dsp is excellant. I have the NIR-12 on my FT-1000 in the shack and the dsp on the FT-100 is equal or better and easier to adjust. Dale KC2PZ

sorry if this has been addressed before.

after using the ft100 on the bench one outstanding "flaw"?? has come to the fore. I have noticed that when using it below 50 mhz, the temp. sensor? cycles the fans and keeps the unit faily cool. nice so far. when using it above 50 mhz the temp sensor seems to be disconnected and allows the unit to heat up fairly quickly. All of this is in receive mode only!

when transmitting the fans cycle on any band.

anybody else see this as a "problem"?

thanks in advance.....73......vic.....ke4lkq

1250. So how y'all doin'?

Boy this list has gotten real quiet.

I cam only assume that everyone has their FT-100 working well, and are too bizy making contacts to bother to post to the list.

Mine is doing GREAT with the Comet CA-UHV antenna. I'm getting really for a little road trip vacation and I've got the SWR flat on the 14.336 county hunter's frequency.

Worked an EA station from the parking lot of a bookstore Friday night - he said I was the second FT-100 mobile he'd worked that evening!

Hello Vic.
It has come up before, but it wasn't a very hot topic - hi.
Yaesu says it's normal, but it's not 100% sensible to me.
The following is an excerpt form digest 79, 5/26/99...

>Now about the fans. I notice that the box gets pretty warm just sitting in
>rx on 2m (consuming about 1.2Amps, normal). It turns out that when the box
>is warm like that, the fans will come on if the rx frequency is 70.500 or
>lower, and will go off if higher. This seemed funny, so I contacted Yaesu,
>and Mike responded:
> >"The fans are controlled by the microprocessor. They will run 100% duty
> >cycle in the HF bands, and only during TX and for 10 seconds following
in
> >VHF/UHF unless enough heat is generated to run them longer. The break
>point
> >for HF and V/UHF is 70.5 MHz. The operations you are describing are
>normal."
>What I see is that on HF and 6m, the fans will kick in (at low speed) when
>the box reaches some modest temperature, then turn off once the box is
>really cool. Above 70.5MHz it's different. Is anybody else getting the same

Soon after that, I did arrange for the fans to run slowly instead of just stopping like that. The box is cooler, and I feel much better now.

I'll take this opportunity to wonder again about what kind of updates are being done when a rig goes back to Yaesu. Has anybody seen any noticeable differences?

Hi. Has anyone come across software for the FT-100? Will other CAT software such as for the older FT-767 work? What about interfaces? And finally, can the memories be added/restored from a computer file? Someone mentioned a reset curing an ATAS-100 problem and it would be nice to re-blast the memories.

In-Reply-To: <379B46AA.EDEA2CF0@...>

My FT100 is quite new (9F042340), and exhibits this feature.

In fact if you program up 3 consecutive memories with say VHF, HF, VHF,
then delete all three memories, the fan will come on, then off as you scan
through them. Spooky.

It is reassuring to note that the fan does come on before the rig cooks
itself on VHF/UHF.

Ed,
Did you change the F48 & F49 settings to get the fans to continue to
run?
If so, what settings do you recommend?

By the way, I've been a lurker on the list for the last few
weeks...taking 3
night classes and working full time doesn't leave much time for posting.

But a quick up date on this end... radio working fine with its new PA
board. Been putting it through its paces in the mobile for the
last few weeks (after the 2 trips back to RT Systems.) Keeping my
fingers crossed and enjoying a neat little toy.

73's to all,
Dave

1259. FT-100 repaired

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-28 15:50:29 UTC
From: Robert Gauss
Topic: 1259 Message: 1259

For reference, my FT-100 failed on Field Day, no HF power out.

Mailed to YAESU 6-30-99 Back repaired 7-13-99. 14 days door
to door. Great service.

Repair - replace one chip resistor RMC1/2330JCTP $.09
Reroute coaxial cable to eliminate oscillation,
verify proper operation,
tested to specifications labor $50.00
shipping $18.30
warranty repair no charge

The comment about rerouting the cable is a new one to me.

No comments about updates.

For the person tracking serial numbers, mine is 9E031595

Did quick verification of full output on all bands. Have made
a few contacts on 17 meters with hamstick type mobile antenna
and got good reports.

Checked for 145.41 birdie reported and I have it as well.

Checked for a birdie at 432.08 that I had before the failure.
Its still there.

It seems to me that the radio has more audio out than before.
I use to run the volume control near max to get reasonable
level. Now it is more near mid range, and max volume is real
loud. That's better.

Bob

When I told the tech (at Dayton) about my FT-100 troubles, he mentioned something then about re-routing cables. My rig had no mention of it on the repair order, I think it fell under the "performed all applicable mods" line item.

Hello all.

from bill wj2l/4
>>one question, has over heating ever
>>occurred burning out componets in this radio?

On the list, several folks describe replacement of defective parts, but there isn't much about the root cause.
It just seems funny that the case is allowed to get hot under some conditions, because you know the insides are hotter. Yaesu programmed the controller to think the box needs to be cool during rx on HF/6 but doesn't need to be cool during rx on 2/440. I haven't figured out the rationale, so I'm opting for coolness.

from Dave WB4NCT
>>Did you change the F48 & F49 settings to get the fans to continue to
>>run?

Nope. I wondered, but never did find out what those F-settings do. I tinkered with the dc drive to the fans -- put some diodes from the switched side to ground to keep them running.

From: scotd57@rapidnet.com
Topic: 1263 Message: 1263

I am glad to find this list and would like comments from people that have owned both the ft100 and the IC706MKII, I am trying find out what others think of the two radios, before I buy.

To be honest some of the troubles that I have been reading has made me a little nervous about the ft100, I was wondering what the failure rate is?

If the PA trouble has been fixed at the factory what is the begining SN, or when is it going to be available?

I have a Kenwood 870 now, how does the dsp compare?

Thanks
Scot

Hi Scot

I'm a new owner of the FT100 and I know very well IC706 MKII (it was my previous one). I use them as my second (mobile) equipment.
There is a significiant difference between them.
Most important is better quality of RX part in FT100.
Some other adventages of the FT100:
effective DSP
simpler and user friendly MENU construction
I've have been use my FT100 for 1.5 month and no troubles up now.
For those who trace Serial numbers, my one is: 9E031949.
The final conclusion is - it was a good decision to replace my IC 706MKII for FT100.

1266. Re: Ft-100 or IC-706MKIIG

Yahoo group: FT100 (1998 — 2000)
Date: 1999-07-30 15:18:45 UTC
From: Charles Scott
Topic: 1263 Message: 1266

Scot:
I have both an FT-100 and an IC-706MKII. I much prefer the FT-100 for fuctionality, ease of use and particularly receive performance. I had to use the 706 in our VAN when we went on vacation for a couple weeks this month and was continually dissapointed with it's inability to cope with signal levels and noise for mobile operation. It's also, as someone else has pointed out, more difficult to use due to the nature of the menu layout.
My particular problem with it is it's extreme difficulty for working repeaters, and if you're not going to have a separate VHF/UHF radio, I strongly recomend you don't plan on using the 706. I spoke at length with an ICOM rep at Dayton about this and asked him about the 706MKIIG to find out if they fixed the lack of automatic offset and such. He said specifically that they didn't. However, I just read the QST review of the 706MKIIG and the reviewer said that the G does have the auto offsets for repeater operation. You should certainly verify that if you're thinking of a 706MKIIG. Also note that there is a module you can buy for the 706 that plugs into the radio and does the automatic offset for you. I'll be getting one for my radio but haven't seen one work yet.
Clearly, the most significant differences between the radios are the performance of the noise blanker and DSP, which is far superior on the FT-100.
Also note that my 706 totally went belly up (total failure) after a few weeks of operation and had to be sent back to ICOM. My FT-100 lost output on VHF/UHF and had to go back to Yaesu. Both fixed the problems in a timely fasion and both radios work now.
Now for the funny part... I did have a minor problem with ICOM in that I had removed the DSP module before sending it back to see if that's what was causing the problem with the radio (I had installed it about a week before), which I fully explained in my letter. The ICOM tech of course reinstalled it after he fixed the radio and then tried to bill me for installing the option! I even talked to a supervisor who also insisted that they MUST charge me for installation of the option if it's in there. I told them not to bill me for that but rather to remove the option, return the radio and I would reinstall it myself. Not surprisingly, the option remained installed and they didn't bill me for installing it. Curious behavior.

Hi Pres

Are people talking at cross purposes here? Surely the CAT program simply allows control of the radio by computer? There may be some set up functions for engineering in here I suppose but they'll be well hidden to stop accidental corruption.

For the record I'd like to set the fans on all the time but slowly during receive. Fan noise in the car isn't usually a problem with a Subaru.

I just bought two VX-5R BTW so I'll doubtless pop up on that list as well.

Cliff

Nice answer Mark, kinda what I expected. Re dead hf. I took the 17 meter ham stick off because last week it seemed too quiet and installed the 20 meter one. 20 is always active. Yesterday I when out at noon and couldn't make a contact. Heard maybe 4 clear QSO's and some uncopiable stuff. Called CQ several times, high and low in the band with no results. Any interest from anyone in a noon hour informal net or schedule? What band? I'm near Cleveland OH. I have mobile antennas for 40,20,17,15,10,6 meters. Only carry one at a time though. 8 ft stick on trunk of Neon with hot pink guy strings to keep it upright sure gets a lot of confused looks. I just made a sked with John W8JW Rochester, NY for 40 meters
tomorrow. It was replied to the net so you should see it. Try and
join in.

I think 17 would work good for us. Last week I worked into Kansas, and
southern Illinois on 17.

Ill sked 17 with you for monday. Via e-mail either friday pm or monday
am.

Hello list.

I am building the Ramsey doppler DF which is based on the recent QST articles which is a rehash of the orginal Roanoke design. I haven't completed it yet because I can only find time to work on it in spurts. I was also shorted one IC and one transistor that I sourced locally.

Would appreciate anyones comments on dopplers in general or this design/version in particular.

What should I be looking for or expect in the testing and use of this unit?

Ill let you know my results as they come in.

So far I would say the PCB was of good quality, the assembly instructions varied from giving too much detail to assuming a reasonable knowledge of electronics. Package looks nice.

To ultimately save bandwidth on this list, might I suggest that fellow Foxhunters or anyone interested in Radio Direction Finding take a moment to subscribe to the Fox-List, a long-established reflector dedicated to the subject. Activity on the list is in spurts, but there are lots of both experts and newcomers around, so if you don't hear anything for a while just post a query or wait around a little... Things will heat up.

For directions, here's an excerpt from the message you get when you subscribe:

Tom,

I know you want to join the net too, but I suppose this is called
incentive licensing :-)

You may want to check Part 97, but the last time I looked, TechPlus
ops had all the novice CW freqs available to them, too.

Give them a shot! You'll be surprized how quickly you could get to
General class if you push the key for a few weeks.

Good luck on the CW. I had a devil of a time getting my speed up to
13wpm. To make Extra, I LITERALLY had to HIDE all my microphones (in the
ceiling!) so that I only could use CW if I wanted to ham it up.

Now it's almost all I use... but not in the car with the FT-100! I'm not
THAT good.

1288. 440MHZ TX Shutdown

Yahoo group: FT100 (1998 — 2000)
Date: 1999-08-07 15:52:51 UTC
From: W1PO@xxx.xxx
Topic: 1288 Message: 1288

Hi Users,
Have had my FT100 since May and been a superb radio. Recently experienced the radio on 440MHZ intermittently showing an SWR imbalance with the TX shutting down. Thought I had an antenna problem so switched to known good flat SWR antenna. Problem persisted. It displays the SWR ICON in the left upper corner of the display and then mysteriously resets it self and transmits OK after varying time periods. While in the SWR shutdown mode the TX seems to oscillate and when the mic button is released, the receiver is also desensed. Yaesu service admits they have one in the shop with the exact problem now. Mine's going back for update and repair. Anyone else seen this problem? I also saw something similar on 17 meters HF where the SWR ICON intermittently came on also and shut the TX down. The receiver did not desense on HF and I remedied the problem (I think) by disconnecting the additional ground connection from my Outbacker Perth Plus. The antenna performs flawlessly and I can work about anything I hear on any band, so the performance of the antenna didn't seem to degrade. Never saw this again on HF. Might be something in the radio now as I think about the UHF problem.

Has anyone tried interfacing an external mic. I'm trying to make my Hiel headset work with no luck. Yaesu claims you need to connect a 27k ohm resistor between gnd and pin6 to key the radio. In fact that's what I measure on the stock mic connector. However my adapter doesnt work. Any ideas would be appreciated.

Hi Bill,

You could probably also switch the Xmiter with the PTT line on the data jack and not have to hassle with the dropping resistor. I would very much like to know how you interfaced the dynamic element of the Heil mic and also where you located the 6 pin modular cable for your interface. I have been trying to help a friend who just purchased a FT-100 and wants to use a different mic.

Lots of luck with your project and please post the results.

1298. Equipment or pilot error?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-08-11 14:20:29 UTC
From: dosborne@pipeline.com
Topic: 1298 Message: 1298

Hello to the group.

My problem with the FT-100 is as follows. On receive in any mode and below 33Mhz I get a base (without antenna connected) reading of 10db over s9.
When I tune up to 33Mhz s-meter indication drops to zero. Separating the antenna from the power supply while adding ferrite beads to the power
lead has no visible effect' nor does adjusting APO, AGC or the Rfgain/squelch. As a matter of fact rotating the squel/rf gain control clockwise
has no effect on the meter reading.
Any ideas

Derek

From: SS409SS@xxx.xxx
Topic: 1300 Message: 1300

Hi Rich here,

I am curious to know if anyone found a duplexer which allows hf thru
6m on one port and 2m/440 on the other. This is an odd arrangement since both
of the duplexers I have are 1.3 thru 2m on one port and 350mhz to 500 mhz on
the other. The retail rags are no help since the dups they list do not
specify this info.. I have the ATAS 100 and I would like to use that as the
main antenna instead of creating an "antenna farm" on my car..
Anyway, this is one helluva radio, I really give Yaesu a thumbs up with
this one!! Richy

Comet makes a CF-530 1-90 in and also 125-470 input
Handles 600 watts and is 66 bucks in the texas towers catalogue page.

There are several Comet has one and Diamond has one. What you want to be sure of is that there is DC continuity through the duplexer. The antenna uses DC current on the coax to tune and if the duplexer does not pass the voltage, when you switch to vhf/uhf, the antenna will not fully retract. I can look for the model number that I am using by Comet if you wish. I use the Diamond MX62M HF-6m on 1 port and 2/440 on 2nd port. It works perfectly with the ATAS (aka full DC continuity) However, I'll warn you now the ATAS sucks on 2m/440. I'd give it the equivalent of about a 1/4 wave spike on both bands.

Jess AE0CW >>

Hi Jess,

My comet is passing the dc to the ATAS no problem. My concern is that the
duplexer I have has 160m thru 2m on one connector and 440 MHz on the other.
In the AES catalog they show duplexers but are vague on what ports carry what
signals, I really like the radio and the ATAS is super, It looks kinda
"phallic" and gets lots of laughs from the local hams but works like a dream.
My next addition is the tone decode board and the proper duplexer. I will
also add some other items as I go along..
I did buy a case from Office Max, its the case for the IOmega zip drive.
Its $30 and the radio fits pretty good. I use the built in pocket for the
manual and moved the velcro compartment to the left where the mic, power
connector, data jack, duplexer fit like a gem.. The radio fits real good in
that case but the vfo knob pushes it out a little in the front. You can
remove the face for a perfect fit especially if its going to be bumped
around... Check it out.. Richy KB2CPW

Yes. Home & Function Power on was one of my early actions. The receiver is noisier than I remember it being on HF so I am not sure if this is a metering problem or if there is S9 +10 db of noise being generated locally (rig or power supply) and is limiting my effective sensitivity. I would like to try the s-meter or receiver sensitivity settings in the service menus but I forgot how to access them, can someone please remind me how to access these menus.

Thanks
Derek

Jim,
I am using a Heil headset. The adapter is straight forward. I bought a 1 foot 6pin modular jumber from our local Hope Depot. I cut the jumber in half and connected it to a male 5 pin mic connector. I followed the pinout for the Yaesu 5pin mike on the FT1000 and the pinout for the 6pin on the 100. All I needed to add was a 27k ohm resistor from SW1 through a spst switch to ground to key the radio. The impedance of the Heil mike must match the 100 because I'm getting excelent audio reports.

Hi, I use the comet IC-706 it covers 1.3-57mhz on the hf port and 75mhz to 550mhz on the vhf port which lets me receive the fm broadcast band also with this duplexer. Diamond also makes one which covers the same range allowing you to cover the fm broadcast with it.

Using the FT100 and ATAS100 combo. Question is this:

When switching to 144/440(using a Comet duplexer) is
the ATAS100 supposed to retract automatically? or
do you have to retract it manually?

Has anyone figured out how to auto tune the ATAS100 when
switching bands? ie: without having to press the TUN button?

Hi,

According to the manual it appears it should retract, but it does not. In fact if you use ATAS-2 setting it will occassionally lose it's mind and it takes awhile for it to get back in sync. The best is to leave it on the ATAS-1 setting and simply switch to 6M and let it tune there, then use on 2M/432 and it seems to work fine. I ask Yaesu about this and they confirmed it did not work like the manual said it should.

I believe the antenna is totally manual in operation. The manual does
indicate that the antenna may take a while to find a proper match including
going the wrong way, stopping and researching in the opposite direction. I
found that keying the mic and using the up/down key faster in getting a match
since you know where you came from and can judge a match from there. For
instance: If you are on 40 meters and want to go to 10m, you can go to the
10m band, they key the mic and hit the down button to retract the antenna and
watch the swr bar graph for a proper match.
What I found is that you can confuse the radio into not finding the proper
match especially if you interupt it in its tuning sequence. The simple thing
is to see how far it is up or down and manually direct it to a match..
Regards Richy

To continue this mini-thread.

The antenna does work very well with the TUN button as long as you set the radio to the ATAS-1 in menu #61.
I use it everyday now in that mode. To use it in manual mode requires watching the SWR display as suggested which should require stopping the vehicle or it will be very dangerous.

The other thing I have noticed is the routing of the feedline from inside to outside the vehicle can be critical. I run mine just out the tailgate of my van. If the cable is to close to metal (or so it seems) the antenna will not work properly. But once I played with it for awhile and got the feedline in a position "it liked" the antenna works very well just using the TUN button.

I now routinely switch bands without even slowing down and always retract it to the 6M position before pulling into the garage.

I have worked many DX stations with it including mobile to mobile with a JA.

1323. Up & Down Stepping?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-08-12 21:11:51 UTC
From: Richard Newton
Topic: 1323 Message: 1323

I wonder if any other members of this list have found the following situation which I have found on the FT100 which I have had recently?

If I step "up & down" the amateur bands, initially these were just to a frequency within each band, but if I tune to a frequency outside the amateur band, then this produces "ANOTHER" step that the up & down goes to. If I tune this out of band frequency back into the band, THEN this seems to REPLACE the frequency of what was in that band before and the out of amateur band frequency still appears. I cannot find anyway of deleting these additional steps, other than I surpose doing a "cpu reset".

Speaking to the dealer, he tells me that these are additional VFO's that appear and a Email to Yaesu (UK) has not yet been answered.

I too have experienced the "extra" frequency during stepping up and down the bands. I find that if you go to another band and do it again, the first one will disappear. So it appears there is only one extra setting possible amongst all the bands. It changes each time you perform the operation. I do not find it bothersome -- just interesting -- and in fact handy at times.

Your assumption is correct, I noticed the same thing when you tune in any
genral coverage area, the steps will increase to include the "out of band
frequency". Richy

Can the FT-100 US version be unblocked by either hardware or software mods? Please reply privately if this is not discussed on the reflector.

Paul,

Would you be kind enough to compare your FT-900at to the FT-100?

I have been looking for a ft-900at for a mobile rig until the ft-100
arrived.
Your comments may help me decide if I should continue the search.
I think I will wait on the ft-100 purchase until Christmas.

The FT-100 beats the FT-900at hands down as my choice of the two for mobile operation. Now, that may not be the case for everyone. I do a lot of 2M FM on the local repeaters and not having a second rig in the car is great. On the other hand, the FT-900 head is remote mountable (I just invented that word) and although it does not give you EVERY function, it's quite usable, the built-in tuner is nice, but makes for a bigger rig. If I was ONLY going to one one HF rig, I'd probably have stayed with the FT-900 and not done nearly as much mobile work. 73! =paul= W8KC Collector of Ten*Tecs and other fine plastics On Sat, 14 Aug 1999, Jack Kovar wrote: > From: "Jack Kovar" > > Paul, > > Would you be kind enough to compare your FT-900at to the FT-100? > > I have been looking for a ft-900at for a mobile rig until the ft-100 > arrived. > Your comments may help me decide if I should continue the search. > I think I will wait on the ft-100 purchase until Christmas. > > Jack > > ---------- > > From: Paul R. 1330. External Speaker

Yahoo group: FT100 (1998 — 2000)
Date: 1999-08-14 14:55:13 UTC
From: Mark Levine, D.C.
Topic: 1330 Message: 1330

Since I haven't purchased an FT-100 as yet, I have several questions which I would greatly appreciate answered.

When remote mounting the face plate, I understand a remote speaker is needed if the radio is in the trunk. Just wondering what most people are using. Also is the 6KHz IF filter useful for AM SWLing from the car? Anyone have an FT-100 mounted in an Audi A6 having RFI problems?

1331. Equipment or pilot error

Yahoo group: FT100 (1998 — 2000)

From: dosborne@xxxxxxxx.xxx
Topic: 1331 Message: 1331

I tuned (by ear) for maximum receiver sensitivity just up to the threshold of any s-meter indication and the rig seems to be fine now :>). It seems that the inevitable service shipment to yaesu has been delayed once again.

Paul, I would like to have HF and VHF/UHF on separate radios for the car so I can listen to both at the same time! I have 5 dual band VHF/UHF radios and only lack the SSB features of the FT-100. That is why I am looking for a FT-900at. A assume you are saying the FT-900 is a better HF radio per it's performance not features? If you the FT-100 is a hands down better radio in HF performance then Christmas will be a good time for the FT-100. I have heard the Noise blanker is second to none on the FT-100? That is one of the most important performance items in mobile operation. Thanks for comments, Jack ---------- > From: Paul R. Mark,
I use a Motorola external speaker that I bought at a local hamfest for about
$3.
I added a plug of the correct diameter and ran the shielded cable thru the cab
of
my truck. I have the radio mounted under my seat and the speaker is mounted
just to the left of the seat. I did this so I could hear it better than the
other people
in the truck and also it keeps it out of sight and out of the way.

That would be subjective since I do not own both radios to compare them directly.

> If you the FT-100 is a hands down better radio in HF performance then
> Christmas will be a good time for the FT-100.

No, in my case, it is a hands down choice because of features. The term "performance" in mobile operation means very little. A mobile environment is no place to be worried about "performance." You need to worry about operability and convenience. ALL $1000+ radios have the same basic "performance" in a mobile environment.

> I have heard the Noise blanker is second to none on the FT-100? That is one
> of the most important performance items in mobile operation.

The finest noise blanker I have EVER seen in a rig was the one in the Ten*Tec Triton IV. Even Ten*Tec has yet to built a filter that good in the newer rigs. The FT-100 isn't even close to that rig as far as the NB goes. Yet, the FT-100 NB seems to work well, in my car, and everyone else raves about it.

Question: I thought my FT-100 came with the 6khz filter. And when I use it, it can open up the front end enough to allow portions of the U.S. am broadcast band to be obvious in the background. Turning off the preamp, or turning on the attenuator, or, of course, switching to the 2.4khz filter seems to block the offending signals. They are unchanging with the setting of the vfo, and most obvious on the 75m band. Is this the proper operation, or is my new radio malfunctioning?? I don't think that it is bad, it just has a very sensitive receive. Jim KB8UNU

Paul:
I'd admit that certain features and ease-of-use are generally more important in the mobile where at lest some attention needs to be diverted to driving. However, I don't think you should totally discount the importance of performance. To begin with, as you seem to indicate with other comments you made, a good noise blanker is VERY important in a mobile. Even though I drive a diesel, there's frequently noise from other vehicles, power lines and such that make operation a challenge. While it's not perfect, the noise blanker in the FT-100 is pretty good and is one of the things that sets the radio apart from the IC706 series. Most importantly, it shows very little problems with strong signals on the band that drive other noise blankers bonkers.
Other aspects of performance are also pretty important. Once you get past the noise issue (in some vehicles with a great deal of work), receiver sensitivity can be very important since mobile antennas are usually marginal. Many other aspects of receiver performance can also be important such as selectivity and strong signal handling since unlike a fixed installation you may pass fairly close to other signal sources.
I guess I'd actually have to argue that performance in a mobile is often more important since the better the radio performs under a wide range of conditions, the less difficulty there is in using it and receiving signals and therefore the less of your attention is required to operate it. Including all the options I got with my IC706MKII, the radio was significantly more than my FT-100, certainly well over the $1000 mark, and in my opinion it's performance is not acceptable for mobile operation. That's why the FT-100 is in my Hummer and not the IC706!

>Also is the 6KHz IF filter useful for AM SWLing from the car?

Mark,

I can confirm that the 6kHz filter is necessary for any AM monitoring (aircraft, ChickenBand, SWL broadcast, etc.) I installed one after Dayton and it made all the difference. However, be aware that audio quality suffers greatly when the noise blanker is inline. Hope this helps!

Installation: '98 Honda Civic EX, FT-100 under seat, control head under center dash, ATAS-100 mounted with Diamond K400 on leading edge of trunk lip. Serial #9D021040 -- no failures... knock, knock.

73,
Ray W8RD

Thanks, Mike. On AM, I can choose 6.0 and the audio definitely gets much wider, but this must just be unfiltered, and I'll need to obtain the 6kc filter to do justice to AM. Jim

My only problem is that it works TOO good! If I adjust it from level 6 to level 7, local signals begin to distort requiring me to drop the IPO or ATT into action. If I set it to level 6, ignition noise is still present . When I go to level 7 it disappears but the locals are distorted. The truth is that I still think this is one of the best NB circuits around, it simply requires some tweaking from time to time. Richy

Your observation is an expected result of use of any good (IF) noise blanker. The manual even mentions that in the presence of strong signals the NB performance will be better with IPO or IPO+ATT. I leave the NB at 12 or 13 except when near lots of flourescent lighting. I then set the DNF on, and DNR on. Then push and hold DNR to access the variable level control, set the volume all the way up and squelch open, and use the DNR level from the big knob to vary the volume... The IPO still needs to be turned on (turns off preamp) for strong signal environments. Try that and see if you like it. I do this for 10M during the daytime.

Hi Tom and Tnx for the help, I am wondering where you "hang out" on 10m?
I am there most of the time and hope to speak to you on the air from my
mobile. Anyway, I am adding in a mobile speaker to the mix, I find that when
you use the dsp the audio "basses up" a little bit causing the volume to drop
when using the internal speaker. This is my own personal observation as I
drive a very loud 89 Firebird to work everyday. I was using an Icom 726
which had plenty of AF and a nice big speaker inside its housing but I opted
for a smaller and easier to carry rig with more features. I just removed the
duplexer and went with a dual band cushcraft for 440 and 2m, I will use the
ATAS 100 which BTW got very good reports on 10, 17, 40 etc.. The only band
which is giving me a problem is 20m. I cant seem to get a low swr but I
suspect the coax is a bit of the problem althought the swr is good everywhere
else) and that my mount stinks. I ordered the Diamond mount and low loss
cable and I am awaiting its arrival.. If you want to try to catch me during
an opening, check out 28.450, 28.435 as I am there quite often.. Good DX to
all and keep the hints and tricks coming!! Richy KB2CPW

Would appreciate your letting me know what the correct procedure is for discontinuing my subscription to the 'onelist' as I no longer own the FT-100. It's really a dynamite rig - especially when used mobile with Yaesu's automatic screwdriver - kind of sad to see it go. Worked 22 countries and many, many stateside contacts, but decided that HF mobiling was simply not for me.

Also enjoyed the onelist postings a great deal - keep up the good work.

Thanks,

Hi,

I am comsidering the purchase of a FT-100 (when I have the $$). As such, maybe someone could tell me...

1) Does the CTCSS tone decoder board also decode DCS signals? If anyone hasinstalled this option, how well does it work (intermod rejection, etc.)? I have a friend who likes to use DCS enc/dec. I thought it interesting that the FT-100 is CTCSS and DCS encode only, as the 847 decodes as well.

2) How suitable is this rig for 6m/2m/70cm dedicated use? As I am currently a tech, and not licensed for HF (yet), I am looking for a good all-mode mobile. FM is nice (boring, too), but I'd like to work SSB as well as other modes. I am having trouble finding only 6m and up mobiles with more than FM capabilities. Besides, the whole point is to be flexible, right?

What would be really nice is a rig that works 6m, 2m, 1.25m, 70cm, and 23cm, but that is kind of overkill. Besides, how widespread is the use of 220 and 1.2G, anyway? I'm just fearful that if we don't use these bands, we'll ultimately lose these bands.

Well, those are my two questions plus miscellaneous rambling.

Thanks,

--Phil Rosenberg-Watt

Hello??
This "Hello??" was sent to me by Jim LeFevre, but no more content.

I would like to present myself:
I bought my FT-100 in Dayton this spring and have been mobile on shortwave since then.
I have worked som hundred QSO's since then, both FM, SSB and CW (while driving!).

I am gathering experience and I also have had problems with the radio already.

I am using the FT-100 remotely mounted with the front panel on the dashboard to the left of the steering wheel and an external speaker which is mounted above my left ear.

If you like, I can email photos as well. (Tried to attache them, but the mailer says they exceed the maximum mail size.)

Cliff,
I've been interested in your efforts to use the Heil headset with your FT-100. Just thought you'd like to know that I just completed wiring up a studio mic thru the new W2IHY 8-band EQ into my FT-100. Now the xmit audio, with the TX carrier points set at about -50HZ, is so incredible it's astonishing. The only hitch was having to get a mic cord from Yaesu with the modular plug. The rig has beautiful audio engineered into it, so why did Yaesu have to compromise their achievement with such a mediocre hand mic? Also, if you're "into" good audio, try using an efficient hi-fi speaker into the spkr jack. My rig has enough audio output to run a pair of these speakers. Who said this was just a mobile rig anyway?

That's fine and dandy but what's the point in having a radio capable of 100 watts. I don't mean to sound cynical and I know that this isn't Yaesu's tech support line but, what good is a radio when I can only use 25 percent of it's capability to make it work properly. Retorical question I know...Anyother ideas anyone? Please....

Topic: 1364 Message: 1368

It's definitely 100W PEP. 100W of AM needs definition but if we are talking about 100W carrier then fully modulated (100%) that gives 400W PEP if I remember correctly. Hence it would sound grossly distorted. So basically if 100W PEP is available then 25W of AM carrier is equivalent to 100W PEP. I personally would turn the carrier down to 20W input. In the old valve (tube) days people ran 100W of carrier modulated by 50W of audio to yield the output signal. Modern transceivers have solid state output devices with low level modulation, usually SSB, being used. Hence when switching to AM it's the AM signal that is amplified by the PA rather than the output 100W being modulated at the output stage. You can see why SSB is more efficient since all the 'talk' power carriers the audio information rather than AM where the carrier power is wasted along with one of the sidebands of course. Dunno whether this helps but I think YAESU should have made 100% AM power equal to sat 23W carrier. Cliff > -----Original Message----- > From: Mark Levine, D.C. From: Michael Jones (KF6SWI)
Topic: 1364 Message: 1369

I think others have covered the topic fairly well, but I'll add my 2 cents worth as well.

As mentioned its mostly a matter of modulation efficiency. A circuit which is optimized for SSB emissions generally only has an appx efficiency of 25% on AM if that mode is available. Many manufactures automatically limit their apparent pep output while in AM to 25% in order to compensate. Only one of the Yaesu rigs I have does that...the FT-920. But, it has a much higher efficiency design for AM and is capable of about 50 watts AM without spectral distortion and splatter. Neither my FT-847 or FT-100 does this and I must manually turn down the RF power to compensate.

The most important thing to keep in mind while running AM on most modern rigs is 'they weren't designed to do it efficiently.' I'll add a few other things to keep in mind as well. If you run more then 25% (unless you know FOR SURE you can run more) then you are probably running well outside the amateur laws concerning spectral purity and harmonic suppression. In addition you may also be bleeding outside of allowed tx modes if near a band edge. i.e. many people like to run AM at the bottom end of the 10m phone band and are actually bleeding into the CW only portion of the band.

From: Walsh, Tom
Topic: 1364 Message: 1370

Or, to put it yet another way (alright, the horse is truly dead, I know), the 100 watts available from the radio can be placed in a single side band, or half in the carrier (no information except power supply quality), one quarter in the lower side band, and one quarter in the upper side band. The side bands convey identical information. When you run AM, you are running with LSB+CAR+USB, and as such you need to instruct the radio not to try to place 100 watts (100% of the power) into the carrier (which is what you are currently doing). Since running AM causes the carrier power to be emitted even when not speaking, it will cause the rig to run hotter than SSB for the same average transmission length. The radio has beautiful AM, although I don't really need it. Take care, and hope you feel better about your rig after thinking about this, -Tom, KB7EFZ -----Original Message----- From: acwells@... Mike:
Well... not so much a matter of efficiency as peak power. The amplifier
is only rated to 100W and (I suspect) is actually limted to about that.
Setting the carrier power to 25W for AM and backing off a bit on the mic
gain provides enough headroom so that the signal is faithfully reproduced.
The peak envelope power (if you want to use that term) can't be more than
100W or the amplifier will distort the signal, and as you pointed out
possibly cause spectral impurity. The actual efficency of the amplifier is
probably the same for all modes since I don't think they rebias the final
for higher CW or FM efficency and is likely typical of solid state linear
amplifiers. In any case, the user's manual describes setting the carrier
level to 25W for AM operation, although it's written so that a normal
person might read that as only an example and not specifically how the
radio should be configured for AM operation. I belive that the person who
did the QST review of the FT-100 missed that point and didn't have the
radio properly adjusted.
Regarding your comment about the bottom of the 10M phone band, I thought
all the AM activity was up at 29.0 to 29.2. About the only AM I hear down
near 28.3 is from out of control CB'ers (who I frequently hear well into
the Ham band). But then I haven't spent a lot of time on 10 lately. Has
there been more AM activity down there by actual hams?

I haven't been there lately but I used to regularly hear a half dozen or so stations there every morning at about 8am pacific time. Believe it or not, actual hams. I even have QSLs from several of them.

I've never heard an english speaking CBer up that high, but I do hear spanish speaking CBers in the novice voice band all the time. Most of the CBers I hear are in the CW portion.

Will there still be some insidious rust/corrosion where the mounting screw tips touch the now bare metal of the flange?

Is there any conductive coating that can be used between the flange and mounting screws?

I'm thinking that dissimilar metals will interact badly and eat holes in the flange eventually.

Get some silicone grease compound. This will keep moisture out. All mobile installations require periodic maintenance to be able to maintain good grounding. Depending on the area that you live you may need to go over your installation about every 6 months and take care of any poor connections and clean metal surfaces to make sure you have a good ground contact.

By the way most of the trunk or hatch back mounts use conductive paint so you don't have to scrape paint off of the mount itself.

Just bought FT-100 from Texas Towers and I asked about the problems with
the FT-100 and they told me that they did not have a single radio that had
the problems.

Have had my FT100 for 4months. 3 contest's this unit operated 100% the 4th the finals went. Had no problems with warranty on replacement of these, but have been hearing about others with this same problems. the first 3 contest's the FT100 was driving a SB220 the 4th was with no amp.
Does anyone have input on the optional filters for SSB and CW. Do they sharpen the RX up?

1392. Ft-100 mobile

Yahoo group: FT100 (1998 — 2000)
Date: 1999-08-29 15:04:31 UTC
From: mike wm.byer
Topic: 1392 Message: 1392

This is my first submission to the FT-100 list. I am running the FT-100 mobile in my 1993 Ford Mustang LX 5.0 notchback.
I have had great results. I live in Asheville NC and I have had QSO's with Hawaii, Moscow Russia, North Africa, and most of Europe. Best luck was on 20 and 17 meters. I am using the ATAS-100 antenna set on a Wilson trunk-lip antenna mount.
When I first installed it, I thought I would get mediocre performance at best; was I ever wrong. I also am using the separation kit, with the radio mounted under the seat, and the control head (on a handmade bracket) set up above the rearview mirror. Impressive set-up. When I first got the radio, I never could get more than about 50 watts out running through various diploes and verticals. The ATAS-100 allows full output. I run 2 and 440 through a dualband vertical.
Any questions please E-mail. Also any body wanting to set up a sked..let me know.

Awww... I wasn't trying to be funny. My FT-100 has been back to
California TWICE. What I'm hoping is that the mods done to it will
prevent that problem from happening.

I'm pretty sure none of the recent rigs have any problems like the early
units.

73, Jim Heath KB6SX

Jim you are lucky it lasted this long mine was DOA when I purchased it a t Dayton!!!!
My brother bought one about the same time and it lasted for about 2 months before dying.
The radio has performed flawlessly since it was repaired. In my opinion the FT100 is vastly
superior to the original IC706 I just keep waiting for the other shoe to hit the floor!

Hello,
I have been using the diplexer from Comet until recently, but I have taken it out now for the following reasons:
- my VHF/UHF final became defective 4 weeks after I had bought the FT-100. I believe the diplexer may have
contributed to this problem.
- tests have shown that the device attenuate about 10dB on incoming signals on VHF/UHF.
So now I use a separate antenna for 2m and 70cm.
Regards
Rainer

Ken,

You need to keep in perspective that there are thousands of FT-100s out there and many have experienced no problems. Quite naturally, there are going to be a few failures and, in my opinion, you are more likely to hear about those on a reflector such as this. And, usually, when there is one notice of a failure, it gets rehashed numerous times. I, for one have had one in the car and on the bench since I purchased it in Dayton earlier this year. So, too, has a friend of mine across town. Neither of us has had a bit of trouble. He purchased his before Dayton. I have used mine for many hours. It's serial number is 9E031371. And, as others have said, the newer units should contain any mods that Yaesu thought were necessary based on reported problems. I would not hesitate to purchase one. It is a fantastic little rig.

The FT-847 may be my next purchase.

Jim, K9BDN

Just as a quick note, mine has a later serial number: 9E032206

It has had very little use as I kept the Icom 706MKII in the car for some time.

I spoke with Yaesu this morning and they said just to ship it with a proof of purchase. No RMA is required. The impression I got was that there were many with the same problem.

Hi Ken,

I have had mine for about 5 months. I run it mobile and use it on the commute and have had it on several camping trips. I have not had any problems with it or the ATAS-100. I use it almost exclusively on HF. I thought about waiting for about 6 months for things to settle down but in retrospect I am glad I did not wait and miss out on a great summer of hf mobile operation.

Think the radio is superior. With any new radio expect bugs. Mine was to the factory and back in 7 days, repaired, and running FB with all the mods. Takes a few months to work everything out. Us folks that bought the first few batches are the real pioneers. It'll stabilize shortly. If you're unsure, wait it out. But you'll be missing some serious fun.

Not yet, but I plan on buying one at the end of Sept and hooking it to my FT-920 as the 1st exciter and my FT-847 as 2nd exciter. I'll let you know then

While monitoring 440m it get's really hot.I also have a problem with rx & tx on 20m only,it will work fine for awhile then in the middle of a sked on 20m it does it thing.People tell me that somebody is Jamming that freq. but to find out it's the radio.One thing is that a friend tape recorded it for me.So yaesu can't tell me this time their nothing wrong.This is the four time for this 9d serial # to go back.Oh by the way doesn't matter house,car or motorcycle.Same thing.
Keep up the hot line maybe Yaesu listening.

Try reorienting the radio...I had the exact same problem as well on 20m. Moved it from under the dash to under the seat and that cured the problem. Never could get it to go away at home. The tech at Yaesu (talked to him in the parking lot at Yaesy Cerritos) also suggested ferrite choking ALL wires; Power, Face, Mic, Speaker etc. Dunno if that helps, cuz my prob went away when I moved it. Good Luck, Mike KF6SWI ----- Original Message ----- From: To: Sent: Monday, August 30, 1999 9:15 PM Subject: [FT100] Gets hot & distortion on 20m only rx & tx > From: ke6wfv@... > > While monitoring 440m it get's really hot.I also have a problem with rx & tx on 20m only,it will work fine for awhile then in the middle of a sked on 20m it does it thing.People tell me that somebody is Jamming that freq. but to find out it's the radio.One thing is that a friend tape recorded it for me.So yaesu can't tell me this time their nothing wrong.This is the four time for this 9d serial # to go back.Oh by the way doesn't matter house,car or motorcycle.Same thing. > Keep up the hot line maybe Yaesu listening. > 73s DE K6WFV > BOB > > ---------- ONElist Sponsor ---------- > > You can WIN $100 to Amazon.com! > If you join ONElist's FRIENDS & FAMILY program. 1418. FT-100 &ATAS combo failures

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-01 07:44:33 UTC
From: Ted Cowie
Topic: 1418 Message: 1418

Morning all -

My radio has failed twice - both times using 6M
I am aware of 3 others that have also failed using 6M and 70cm
The common denominator seems to be the ATAS combination with the 100 VHF/UHF
I believe that the grounding of the ATAS is absolutely critical - imperfect ground = high or fluctuating SWR and thus killing finals etc.
In the spirit of research I would ask those out there who have the "combo" to send me a note if they have had similar
experiences - serial numbers would be useful
If there is a significant finding I will publish and pass the info to Yaesu.

As an added question how does one measure infinitessimal resistance - it may be that mere continuity is insufficient. In my case the
antenna is perminently mounted on the roof

Thanks for your help

Ted Cowie

Hello:
I am considering getting a FT100, FT847 or one a 706 MK II G
I prefer the FT100 from it's spec's, and was wandering how well they are holding up now. It seemed like early ones had a number of troubles, and I do NOT want to have to send it back for repair.
I have had a number of Yaesu products, and the only one that did not work as it should have is my VX-5R I have to send it back, but do not want to give it up!

Tkx in advance

1422. Recent FT100 experiences

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-01 12:58:50 UTC
From: Robert Gauss
Topic: 1422 Message: 1422

Just though I would share some of my recent experiences with my FT100.

For reference my radio has failed and repaired once with no power output on the HF bands. The repair indicated was replace one resistor and "reroute cables to prevent oscillation."

I have been using the radio in portable and mobile operation with admittedly poor antennas.

In mobile use I use hamsticks on a 5in mag mount. The SWR of these antennas is OK and I use a clip-on ferrite at the base of the antenna. In some instances I have seen the power output and the SWR meter jump up and remain up while operating SSB. Just keying the mic is enough. I believe the radio is oscillating, but has not failed and does not do this every time. I am going to work towards a better antenna grounding method but it has to be compatible with my pick up and go approach. More ferrites will be tried, at the radio and on the power leads.

In a recent portable radio with our radio club I was using a 25 ft vertical YM_M4I5S3S_10 mast with two 16 ft YM_M4I5S3S_11 just laid on the YM_M4I5S3S_12. I was tuning the antenna to resonance with a manual tuner. I was tuning in the AM mode with the power set to about 30 watts. As I approached resonance I this YM_M4I5S3S_13 would YM_M4I5S3S_14 again. Never did get the antenna to tune and operate on 20 meters without this apparent oscillation. Could get it to work OK on 17 meters though. Use of some YM_M4I5S3S_15 here might have helped too.

I guess I can't totally fault the radio for this but it does seem to be sensitive to either bad match or stray YM_M4I5S3S_16. Fits in with the comment I read earlier on the list about putting YM_M4I5S3S_17 on 'everything'. For now I am going to try to match up my antennas with an YM_M4I5S3S_18 meter rather than tune with the radio.

Good experience at home with the FC20 tuner. I had reservations about this tuner because it seemed to tune so slow (compared to the TS850 internal tuner) and have a somewhat limited range. I compared it to tuning with an MFJ941 and a YM_M4I5S3S_19 high power YM_M4I5S3S_20-200 and it worked quite well with my base antennas. I have a full size G5RV and single quad loop for 15 meters. It would tune the G5RV 80 thru 15, and the loop 20 thru 10. I had a real hard time with both the YM_M4I5S3S_21 and the HC200 on 80 meters and on 10 meters.

I looked inside all the tuners and my impressions of the YM_M4I5S3S_22 support the YM_M4I5S3S_23 for YM_M4I5S3S_24 that ends in 'junk'. Very long leads, 3 in YM_M4I5S3S_25 coil mounted vertically so the top and bottom aluminum covers are very close to the coil. Must de-Q it a lot.

Capacitor spacing seem close and meshing plates were not well centered.

The HC200 seemed much better built. Higher quality variable caps. Ceramic former 2 in YM_M4I5S3S_26 horizontally mounted coil. Better looking route of YM_M4I5S3S_27 leads. Light duty phenolic wafer switch was major downer. Doesn't tune 160. Downer # 2

FC20 looked very good. No long floppy leads. Tuner apparently uses the binary switched inductor / capacitor method in with the final values are determined by relay switching in inductors and YM_M4I5S3S_28 in a binary order so that large values can be obtained with small increments, this setting can then be stored and recalled with digital accuracy. The tuner also contained two high quality variable caps driven by stepper motors. Only thing that detracted from the overall good impression was the use of a single sided phenolic PC board material in the YM_M4I5S3S_29 section. I would have like to have seen a fiberglass epoxy board with plated thru holes.

Robert: I just have one question...what's a YM_M4I5S3S...? As for your "oscillations" it may be that you're getting RF into the mic input. Try putting some of those ferrites on the mic lead as well as the line at the antenna. Also, as I'm sure you're aware, a good and adequate ground (counterpoise) for the antenna will solve a lot of problems. Grounding is extremely important in a mobile HF installation. Not only do you need a good ground at the antenna and the radio but you also need to make sure that the various body parts are well grounded to each other. That is doors, hood and trunk/hatchback, bumpers, tail pipe. One reason is that in a car or truck the HF ground is capacity coupled to the earth through the body of the car and you need as much of the car body as possible to provide a good coupling.. If you have different parts on the car varying their "ground" level as you drive because of poor ground connections it can cause a sudden mis-match between the radio and antenna which can cause damage to the radio.

Well if it will be any help I do not use the combo and have not had any problems. However most of my operation has been hf.

You can't really measure if you have a good rf ground except by noting how your rig does or does not tune. The best thing to do is just assure that you have a good ground. At the antenna mount make sure you have bare metal to bare metal contact.

Hi Robert,
Thanks for the correction. I was trying to figure out what the heck the ym-xxxxxxxx tuner was. (Hi Hi)

On your mag mount. Is it one with one magnet or multiple magnets? For HF operations the big ones with three or four magnets provide a much better ground coupling along with much better staying power. I have seen these used with full size screwdriver antennas with good results.

I have not had any problems with some of the MFJ tuners. I have used one or another with a G5RV combo both at home and portable with good results and able to tune 80 - 10 with a good match.

Mine is the single magnet 5 in diameter one. Bought at radio shack. It has no hope of holding a hamstick on the trunk at any speed. I use nylon strings runing to the roof rack on my neon to keep in on when driving.

I am not happy with to coax to base transision either. It makes its 'ground' connection by clamping the braid against a chrome steel cup. I am thinking of grinding off the chrome and tinning the region with solder. Then tinning the braid so the clamp will be solder to solder.

I should work on a better coupling to the car too. I want to keep it easily removeable and transferable. An idea I had about was to connect a ground wire to the base and run it into the trunk and use an alligator clip to find an ground inside. May take some scraping inside.

I've seen those and may even construct one. The single 5 in holds like a bear without an antenna. You need the leverage of the antenna to rock it off. I don't know how you could remove one of the 3 or 4

magnet ones without a pry bar.

I didn't have a great deal of trouble, I just commented on the internal mechanics of the thing and found it quite touchy to tune, especially with the radio acting up as it did in the portable operation. At home I connected a 50 ohm dummy load to the tuner and noted the coil select position for best tune just to help get started. I could not get the 50 ohm load to tune to less than 2:1 on 75 meters.

1429. RE: Gets hot ...

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-02 13:07:39 UTC
From: emoxon@lexicon.com
Topic: 1416 Message: 1429

Hi Andrew.
Sorry, I should have included the URL. The FT100 community starts at
http://www.onelist.com/community/FT100
and that specific digest 134 is at
http://www.onelist.com/messages/FT100?archive=134

Now on to antennas. Interesting discussion.
I've noticed some folks say they have good SWR but don't attach a number to it, and I'm wondering what it is. I did a quick calibration on 20 of the SWR bargraph. The 1-bar indication occurs when SWR is 1.5:1 (or less), and the 8th bar flicks on at 3:1. If you play with tuning, 6 bars can appear to be successful, but ends up showing excessive SWR on transmit. At 5 bars I get 2.5:1, and it will transmit into that. BTW, the meter is the MFJ 259B (which deserves a plug -- it's really nifty).
I agree with Yaesu that you've got to have a good counterpoise to get low SWR and solid operation, including ATAS100 tuning. Maybe check out digest 100 (6/18), http://www.onelist.com/messages/FT100?archive=100, it's sort of related.

HUmm, I find it interesting that you say that the sales have dropped in regards to the Yaesu Vs Icom 706, Icom has had as many problems as Yaesu, this is normal when it comes to a new radio as with a new car or anything else. I'm sure if you talked to Mike or someone at Yaesu and expressed your input to them, they would take very good care of you. You also mentioned about Las Vegas, where did you visit? Must have been the local Candy Store. Remember that everyone has there own tastes and feelings about radio's don't always believe what a salesman states to you the Icom costs more and has less to offer, from a salesman point of view there is more commission to them on the Icom. Get the point? have a nice day and Yaesu will take care of you if you talk to the right person and make your FEELINGS known.

1435. ATAS 100 Troubles?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-02 18:03:51 UTC
From: Paul R. Valko
Topic: 1435 Message: 1435

Hi Everyone,

I got a used ATAS-100 the other day and it really seems to work well with the FT-100.

Now, I don't claim to be the brightest bulb in the box, but, do we have to MANUALLY retract the antenna every time we want to use 2M or 400 *after* running HF?

I was under the impression that the ATAS/FT-100 combo had some sort of memory function so that it would adjust the length of the antenna depending upon the band you were on. You know... at least to get close.

ALSO... yesterday, the antenna would not move at all. It seemed to be "jammed" in the fully retracted position that I had MANUALLY set it to to talk on VHF on the way into the office that morning.

I finally had to go and put the antenna in the auto-tune mode and walk up to the antenna and give it a couple light taps to get it "freed up." Normal???

Not knocking the combo, it's the cat's ass compared to the low-bandwidth alternative.

After three months of use, my ATAS-100 stopped moving... it became intermittent a few days before... and then died. I even tried a different mount... same. Reset the antenna configuration (that used to work on the two occasions before)... nothing (even in manual tune mode). Checked the voltage on the coax, and the FT-100 was doing what it needed to do... so, boxed up the antenna, and sent to Cerrittos... I had great results with the combo before the antenna stopped working... tuned up automatically with a great SWR (40 Meters was a two to three bar on the meter, but worked well). Hi Paul,

The ATAS is supposed to work the way you thought and the way the manual says but it does not. I verified this with Yaesu in CA. The best approach is to set the menu for ATAS-1 not ATAS-2. This means you may want to retract it manually for operation on 2M or 440. However, early on someone posted here that they had measured the SWR at all different "HF positions" and all seemed fine for 2M & 440.

I personally switch to 6M and press "TUN" to retract it most of the time. Part of this is that normally I am on 2M repeater on the way home and I want the ATAS retracted anyway so it will go into the garage easier.

The other option is a different antenna for 2M & 440.

I hope this info helps and as you put it really is a dynamite antenna for mobile operation on HF.

Subject: FT-100 AUDIO input adapter

Greetings!

After several weeks of operating and experimenting with the FT 100 'jewel', we have determined here in the lab that it is one excellent piece of equipment. No, not the best radio that ever hit the market - but one of the "funnest"!! Several things - as with every rig - that could be improved or changed. All of us here agree that the cables exiting the back panel look to be a LARGE problem down the line, but a hefty cable tie around ALL cables after installation will cure some of that excess movement....even the two conductors of the power cord should have been 'welded' together - again, wire ties took care of that.

But the BIGGEST problem with the FT -100 is that the digital control data is multiplexed down the MICROPHONE audio input lead which does not allow you to use ANY other microphone, headset or input EXPECT that crappy little paging microphone cartridge that is installed in their mic. SO< I am happy to announce that after many weeks of conversing with the wonderful and helpful folks at Yaseu (a conversation that actually started at Dayton!) we have developed an adapter cable that will allow the operator to remove their touch tone (just what I need on twenty meters!) mic, plug in this adapter and then one of the Pro-Set headsets OR better yet - the new HEIL Goldline studio microphone. With the microphone equalizer BUILT-IN, the FT-100 can be adjusted (with the GOLDLINE studio mic) to equal or excel many of the hi-fi-audio boys on the low end of twenty. This is one incredible addition to the FT-100 and will allow the DX/Contest ops to NOW be able to use their Pro-Set or BM-10 boomsets.

Thanks to many of the test team and the crew at Yaesu.

From: Bob@xxxxxxxxx.xxx
Topic: 1442 Message: 1444

GREETINGS! After several months of operating and experimenting with the FT-100 'jewel', we here in the lab have all agreed it is one exciting piece of gear. No, not the best radio that ever hit that market - but one of the "funnest"! The biggest problem with it is that the digital control data is multiplexed onto the mic audio and does not allow for other audio inputs. SO we have come up with the suitable adapter that allows the use of the PRO-SET, BM-10 OR the New GOLDLINE studio microphone into the FT-100. WIth the built-in equalizer. the FT-100 can be adjusted (with the GOLDLINE studio mic) to equal or excel many of the hi-fi boys heard so much on the low end of 20 MTR. This is one incredible addition to the FT-100 and will allow the serious contest and/orDX op to NOW use their Pro-Set, BM-10 or Micro-Pro boomsets.

Thanks to many of our test team and the crew at Yaesu!

All of us here agree that the cables exiting the back panel look to be a large problem down the road, but a hefty cable tie around ALL of the cables back there after installation will cure some of that excess movement....even the two conductors of the power cord should have been 'welded' together. Again, wire ties to the rescue.

But the BIGGEST problem with the FT-100 is that the digital control data is multiplexed down the MICROPHONE audio input lead which does not allow you to use ANY other microphone, headset or input EXCEPT that crappy little paging microphone cartridge that is installed in their mic. We have also experienced excess RFI problems with the UNSHIELDED mic cable and all of that digital info on the audio leads....transmitter PTT line turning on and off on it's own, etc. SO - I am happy to announce that after many weeks of conversation with the wonderful folks at Yaesu (actually started at Dayton) we have developed an adapter cable that will now allow the operator to use the PRO-SET boomset and get rid of that touch tone hand mic (just what we need on 20 meters!). Now you can plug in your PRO-SET, BM-10 or better yet - the new GOLDLINE studio microphone. With the microphone equalizer BUILT-IN, the FT-100 can be adjusted (with the GOLDLINE stuiod mic) to equal or excel many of the hi-fi boys on the low end of 20

Thanks to the many test team members and the crew at Yaesu who helped us make this happen.

This is what I amalso worried about may happen over here during the winter, when they have salt on the roads and a lot of pollution may come into the antenna. However, no problem yet. About lubring the mechanics: Does anyone have a schematic on how to disassemble the ATAS-100? //Rainer SM5LBR -----Original Message----- From: Geoffrey K. Hicks [mailto:] Sent: den 3 september 1999 02:00 To: FT100@onelist.com Subject: Re: [FT100] ATAS 100 Troubles? From: "Geoffrey K. Hicks" After three months of use, my ATAS-100 stopped moving... it became intermittent a few days before... and then died. I even tried a different mount... same. Reset the antenna configuration (that used to work on the two occasions before)... nothing (even in manual tune mode). Checked the voltage on the coax, and the FT-100 was doing what it needed to do... so, boxed up the antenna, and sent to Cerrittos... I had great results with the combo before the antenna stopped working... tuned up automatically with a great SWR (40 Meters was a two to three bar on the meter, but worked well). Bob, Thanks for the info to the list, it will be a great help. But you are not all correct on when you say you can not hook any other mic to this radio without your adapter. Just wanted everyone to know that in the earlier lists someone(I think Cliff) already figured out the wiring and posted it to the list. I have had my ft-100 since the first of April and have been running a desk mic when I have it on the bench and not running mobile. I use a radio shack head set when mobile and works great. By the way I have had no problems with my ft-100 at all.
I have a Alinco dual band rig that has the type coax connectors hanging out the back and I have used that for over 8yrs with no problems with the cables at all. I don't think that the cables are going to be much of a problem.

No the antenna is just to small. The ATAS100 is a compromise over a full size screwdriver antenna with a much larger coil and whip. You loose some coverage and some performance. I was thinking of getting a ham stick or such and and adapter for the SO mount to use for 80.

Subject: RE: [FT100] and CW Positions and firmware commands:

A friend of mine passed this on to me. Any comments???

An annoying little detail about the FT-100's firmware that I
discovered after installing the second filter: When you install each
filter you must go to the command menu and select the appropriate
filter
functions. In the case of filter number two the options are OFF, 6 KHz,
and 300 Hz. Since I installed the 6.0 KHz AM filter the obvious choice
is
6 KHz. So far so good. When in the AM mode I can select either 2.4 KHz
or
6.0 KHz, ...but in CW mode I can only get 2.4 or 500 Hz (the number
one
filter) I cannot select the 6 KHz filter when in the CW mode, unless I
go
to the command menu and change the filter 2 selection to 300 Hz. If I
do
that, then I can get the 6 KHz filter in CW by pushing the 300 Hz
button,
but I can't use it in the AM mode, unless I go back to the menu and
change the setting back to 6 KHz. I see no good reason that Yaesu does
not let you use all the filters that you have installed in any mode you
like. I personnally like to tune around the CW bands with a wide
filter,
especially when it's kinda quiet or I don't know whether the band is
open
yet.

Chris- An approximate 2.5 Khz wide filter for tuning CW is *WIDE*. Consider that the CW signals you are tuning over are ~50Hz wide. That means you have 50x the required bandwidth for receiving the signal. I find the filter settings intuitive, sorry you don't. -Tom, KB7EFZ -----Original Message----- From: Chris Victor [mailto:cvictor@...] Sent: Friday, September 03, 1999 9:04 AM To: FT100@onelist.com Subject: [FT100] and CW Positions and firmware commands: From: Chris Victor Subject: RE: [FT100] and CW Positions and firmware commands: A friend of mine passed this on to me. Topic: 1453 Message: 1453

I have been kicking around getting either the FT100 or the IC706 for a few weeks. I have seen a lot of bad things about the FT100, failures and such, but no one posts what kind.

I joined here, and on a 706 list, to see what is going on with this radio, so any comments good or bad would be appreciated. If it is old news to the list just e-mail me personally.

Also has anyone applied any of the mods that are posted around the Internet. I am curious if the radio will TX around 46-48 MHz and 470 - 480 MHz.

Thanks

Jim C.

From Bob (W1RAM)

Hi Dan,

My version of the "adaptor" involved using a desk mic, not headset, so I did not address the use of an earpiece. But what I did do was to get a replacement mic cord from Yaesu that already has the modular plug attached (part # T-9206569 = replacement cord for the MH-36B hand. Who needs to deal with crimping tools??? The pin-outs I used are straight out of page 4 of the FT-100 Operating manual. In the MIC Jack diagram, SW1 (far left) is the PTT line and is the blue wire in the cable. Next, MIC IN is the mic audio (+audio if your using a balanced line) and is the white wire. Next comes the ground and is the brown wire. The remaining three wires in the cable (red, gray and green) never get used. Use the blue, white and brown wires to run the mic of your choice. As far as the PTT line goes, I put 47K of resistance in series in this line. I saw that Cliff had done this. I don't really know why this resistance is necessary, but all I can say is I did it and it works. Since I am using the new W2IHY 8-band EQ with my rig, I attached a DIN plug of the end of the mic cable. But I see no reason why you couldn't put on any other kind of plug that will go right into your microphone. Hope this helps. Good luck.

From Bob (W1RAM)

Hi Mike,
Thanks for the note and info. What I thought I said was that an alternate mic for the FT-100 needs AN adaptor, not my adaptor, since I do not know of any microphone out there that already comes with a stock modular plug on the end of the cord. I discovered that using a replacement cord for the MH-36B hand mic (Yaesu part # T-9206569) was a quick and easy solution, but not necessarily THE ONLY solution. In fact, I see that Heil is coming out with their particular version. In any case, my FT-100 is working great. I have tried an array of mics, and right now I am using as a desk mic a Shure BG4.1 electret. With the new W2IHY EQ, the xmit audio is fantastic. You might also be interested to know that I recently took the rig, along with power supply, antenna tuner, EQ, mic, antenna, (and laptop computer) overseas. Everything will fit unto the largest size carry on duffel bag (H+W+D=45 inches) - just put bubble wrap around each piece and pack each on its edge like sandwich bread. I took an entire ham radio station on the plane and it fit with ease in the overhead compartment. The gorillas that pass as baggage handlers never had a chance! Hope this helps.

For what its worth. I too looked at the ft-100 for tuning on 160 and 80m. I'm not talking about the atas antenna. The cpu doesn't let it tune on 80m and 160m. Meaning it does not send any voltage down the coax line for driving the motor on a screwdriver antenna. (You see I use a 3" dia screwdriver 160 thru 10m on my car and wanted to tune it with the rig instead of the manual switch I use now). It would work if you could use a manual switch with the right voltages to the atas antenna and add a coil between the whip and the atas antenna coil to get down to 80m. Is it worth it, I dought it.

Alas...there is not enough inductance.....but by adding a coil under the
ATAS and adding a jumper across the coil, I believe you can tune it on
80 meters. I have not tried it yet....Dale KC2PZ

I have the FT 5100 an FT 8000 both units have the coax cable on the back and
both have been replaced twice! There is a potential problem if the cables
get moved often, i.e., moving the rig in and out of your mobile. The
shielding breaks and the resulting problems can be intermittent. This can
lead to other problems and perhaps costly repairs if not under warranty.

1461. FT-100 pigtal cables out the back

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-05 15:46:25 UTC
From: Robert Gauss
Topic: 1461 Message: 1461

I've seen several comments on the pigtail cables so thought I would add
mine.

I also have an Alinco dual band mobile and have had cable failures. I
repaired it once and then tie wrapped the two cables together for
strain relief. Lasted a long time but still had a second failure.
Then I drilled a small hole in the nearby heat sink fin and tie wrapped
the cables to the sink for strain relief. No further failures (yet)

I was (am) worried about the cables on the FT100. I do move the radio
a lot. I have crossed the left side cables over to the right and the
right side over to the left thne used a single tie wrap to bundle them
together. This offers a strain relief and reduces the amount of
'dangle' from the back when moving the radio.

Since I plan to do the 'under the seat thing', it occurred
to me to mount the radio onto a sheet of thin material, like
plywood, and stabilize the cables by attaching them to the
wood...

Let you know next weekend how it works out!-)

Topic: 1461 Message: 1464

I've mounted my radio on a clipboard to help protect the controls and wires from abuse when moving. I often stuff the radio into a carry bag like a laptop commputer. I also drilled a few 1/2 in holes in the clip board to allow use of bunge cords as a hold down. Haven't needed them yet. When I went to Dayton hamfest, I used the radio in a rented van while setting in the passengers seat, by just standing it on end on the floor between my legs. The board protected the rear of the radio and allowed the fans to draw air.

I used crappy mag mount antenna without much problem. I am concerned with the apparent sensitivity of this radio (maybe all radios) to oscillate with poor antennas. The way I use the radio will not always be in a well grounded situation with well matched antennas. This radio is such an ideal portable rig that I hope the loading / gounding sensitivity doesn't limit this use.

From: Carl & Kim Styan
Topic: 1466 Message: 1466

When the radio is used in a cold or cooler enviroment the cooling fans squeel and rattle!!, they slowly quiet down as the PA heats up. I first found this out during a trip to the North in April. It was 7 deg's C when it first started the noise. At 0 deg C they dont move too fast, one of the fans worked better. I had told this to the engineers at Dayton.....this was the first they heard of it.

Neat idea.

How do you key the radio? Does the vox work on the data tx audio?

1469. FT-100 in an Audi?

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-08 19:33:50 UTC
From: Mark Levine, D.C.
Topic: 1469 Message: 1469

I understand the 1998 - 99 Audi A6 Quattro may be very RFI sensitive and I wonder if anyone is running HF or an FT-100/ATAS (or other antenna) in one. Before I invest in a setup it would be nice to know if I am setting myself up for a headache.

1470. Is it really that bad

Yahoo group: FT100 (1998 — 2000)
Date: 1999-09-09 03:45:04 UTC
From: James J. Caperelli III
Topic: 1470 Message: 1470

I have read a lot of garbage about the FT 100 on several newsgroups, but no one is specific about the problems. Here on the list I have not seen anything bad about the radio, other then concerns about pigtails. What is up with this radio, I need the straight info before I decide on FT100 or IC706.

Below is the post I put on several newsgroups, where all of the trashing has taken place. I just posted again tonight for the second time. After you read this, just think about this, I did not get a single response or even a flame. Yes I repeat, NOT even a flame.

So can some of you guys, and gals, please let me know your experiences, like and dislikes with this radio. If you did have problems let me know the details. You do not have to post to the list if you do not want to, I would hate to clutter it. So you can e-mail me personally.

mrnstar@...

Here is the post that did not get any response.....

.....
subject .. WTB FT100 Dead or Alive

That's right with all of the bad things going on with the new FT-100, we want to buy one or two.

I have seen many posts in various newsgroups about the extreme disgust with this radio.

A couple of us are looking for FT-100's and are willing to work through the difficulties with Yaesu.

If your radio is dead or bad, whatever just NOT smashed, run over, dropped from 6 floors high, etc., you get the idea, I will buy it.

Of course we are looking for an extremely great price. We do not want to spend any more then $250.00 per radio. We will also consider a fair price if you have a working unit that you no longer want.

I would never consider such an insulting low offer any other time, but from some of the posts I have seen, some folks said they are about ready to pitch them. So if that is the case let us know!

Also I am interested in the ATAS 100 antenna. I have seen a lot of bad posts on this also, want to try for myself.

Please send all offers via e-mail to morningstargroup@... or decode the email address in this post and send there. Please do not reply to the newsgroup, since for some reason some of the newsgroup posts are getting lost on my ISP, and I cannot sometimes follow an ongoing thread.

Of course, like all posts, this one will generate flames, send those to mrnstrgrp@.... I will check there first, really!

73's
Jim C.

....

Best part I am willing to work on a fair price for working units. With all those posts of how bad this radio is, I thought someone would sell or make a counter offer. Nothing, so I am starting to think that there really is not any major problems with this radio, just folks who want to thrash it.

This is silly... You can complain all day about how awful these radios are but the truth is that there are a lot of us using them and very happy as well. There are also a lot of us who are nice when we talk to Yaesu and are generally pleased with their support and service. There are as well a lot of us who understand that there are things that can go wrong with the manufacturing of any radio, even one that's been in production for quite a while, as well as new radios that need a few bugs chased out of them and that doesn't mean their trash or the manufacturer was grossly negligent. Yes, my radio went back to Yaesu for a UHF/VHF transmit problem, it was turned around quickly by Yaesu it now works just fine. My IC706MKII also went back to ICOM for warrantee service and it's now working just fine. I find it difficult to draw any conclusions from that other than both raios now work and both manufacturers took care of me when they didn't. I frankly think the FT-100 is a great radio, has a rich set of features, performs very well and is more than robust enough for normal amateur use. Also owning and using a 706, I rate the FT-100 the winner, but that's my opinion. Your mileage may vary. Garbage is all it was. Don't let anybody ever tell you the FT-100 is bad.

Icom are now on the 3rd version of the 706 and it looks pretty good.

Yeasu got it right first time. I reckon that's a bloody good effort.

Icom or Yaesu, it doesn't matter which one you buy, you'll be getting great value for money and a radio which you'll enjoy using for many years.

I personally have the Yaesu. I've never been able to afford Icom.

Nobody in there right mind would sell a ft-100 for 250.00, with the radio not being out for a year yet. Which means if you had a problem with it, its under warranty yet and you would get it fixed. I have had mine since april 1 and have never sent it in for anything. Its preforms great. I wonder how many responses you would get if you did the same for a 706G. I would guess the same..

From what *I've* read, there is ONE guy with a major woody against the FT-100. He's something like DRL*???@.... Never signs with a name or callsign so he's probably just a troll.

I sent my 100 back twice to Yaesu and so far so good. The radio is fantastic, I've worked the world on it from my car, mostly on 20 and 15 meters.

My ONLY problem is that Yaesu promised to pick up the shipping charges and so far, has done nothing. Emails to customer service and even the boss have gone unanswered. Perhaps it's time to phone them, but I don't want to wait forever in some "on hold Hell." Maybe it's no big deal <$50 but I was a little cranked that the rig was gone for almost a month right after I bought it. That deserves SOME compensation, I believe.

Subject: Re: [FT100] Is it really that bad

James- I did see your posting in the newsgroups, but since my ft100 is working fine, and always has, I felt no need to reply. I too have noticed the complaints or comments in the newsgroups. However, I notice also that the vast majority of them are from DLR18SH or something like that. He does not own one, and the statements he makes are entirely incorrect. I am frankly somewhat confused about this individual, as he makes comments about things posted in the onelist group, and upon a review, no such thing was ever said in the onelist group. I suspect that he is what is commonly referred to as a troll. It is unfortunate that he has targeted the ft100, as the radio is certainly worth a good hard look.

The problems that have been reported seem to relate to the finals on the radio not working, often after minimal use on hf, and particularly 6 metres. What happens is that the transmit shuts down, and no power out occurs.
The problem appears, from the onelist group, to have been one that effects some percentage of radios, and a listing of serial numbers was taken from all participants to determine just how many radios were affected. Unfortuneately, that list never became complete. The listing last posted for example did not include the serial number for my radio, although I had sent it to the author of the serial number list. I have had no problems. Even looking at the list that was compiled, it certainly did NOT suggest that 1/2 of the owners (the figure given by DLR18SH) had suffered the problem.
Yaesu has been very good about fixing the problem immediately when it does arise.
I've been very happy with mine, and it appears that others have been as well. I particularly like, over the 706, the large number of memories that it has. I travel around a lot, and have programmed in all the repeater frequences for 2 metres and 70 centimetres, so I can scan them all steadily.
If you look around, in the onelist, someone posted a comparison of features. I believe that the ft100 offers more, and chose it after long and hard consideration between it and the ic706mkII. As I said, I have been very happy with it. My satisfaction so far is such that IF the finals did go out, I would send the radio to yaesu, have it repaired, and would still be very happy with this rig.
I am not employed by yaesu, and have never previously owned an icom or yaesu product.
REgards, and whichever radio you choose, I hope you will have the same enjoyment of it that i have had.

Hi James.

I saw your post on the newsgroup. Personally I thought it was a troll and did not bother to reply. Besides why in the world would I want to give up my radio for 250 dollars when it has not had one problem. The fact that you did not get any responses shows that those who own a FT-100 are not about to give them up for such a low price.

If you want to find out how FT-100 owners feel about their radios then just ask. This has happened many times on the r.r.a.e newsgroup and every time it results in responses from satisfied owners and of course always a response from Tim the troll.

I got my FT-100 last spring and have used it mobile all summer. It is used daily on HF and has gone on at least 5 road trips to some remote areas. I have not had any problems at all. I use it with the ATAS-100 antenna. My favorite mobile band this summer has been 17 meters.

It was a tough call to decide between the FT-100 or the new ICOM but the FT-100 seemed to have more of the features that I wanted including a much superior noise blanker which is a must for mobile operation. If I were to buy another mobile hf rig today it would definitely be another FT-100.

As far as bad reports on the newsgroups.....

Do you frequent many newsgroups? If you do you will soon learn that while the concept of a newsgroup is great, the fact is that very few of them have much useful information. For some reason there are folks out in society that just like to stir up muck and find that they can have a blast using a media that they can remain a faceless entity and not have to actually face up to what they spew.

If you read the posts you will find that there is always someone who is going to bad mouth a product. When this person posts with a false e-mail address and won't even post his call letters I have to wonder. What has this person to hide? The FT-100 is not the only product on r.r.a.e to be put down by folks who have never even seen one let alone bought one.

Tim the troll will jump at any opportunity to put down the FT-100. He was on this list for awhile but was either asked to leave or left because he could not stir up his muck here. If you read his posts on other subjects you will find that this poor chap very seldom says anything positive about anything. How sad for him.

Look at the archives here and decide for yourself which radio you want. We all have our likes and dislikes and what you like in a radio someone else may not. It would be a very boring world if we all liked the same thing. I use a

different radio for base or extended portable operation because I have different requirements in those environments than I do for mobile operation.

73
Mark
AB0HJ

P.S.
Now that the FT-100 has been out for awhile you should be able to go to a ham event in your area and meet someone who will let you try it out for yourself.

Hi

is there a description of the CAT commands in the manual?
I remember that all YAESU rigs had different command sets.
(ICOM remote control is quite simple and they use almost
the same basic commands for the IC735,706 etc.)

Is there a service manual available from YAESU for this rig ?

Here I used one of the first IC706 models for about 10 weeks in the car, but
today I had to return it to the owner. I would like buy an IC706MKIIG but
unfortunately because of the large RX/TX delay times of the IC706MKIIG on 70cms ,
there is no choice if you want to operate PR 9K6. So I intend to buy the FT100.

Many thanks to all who responded, both through the list and privately.

It confirms just what I thought, or was hoping, that the FT100 is no better or WORSE then the others.

I did recognize some of this as a troll, but what scared me was when I talked to the dealer that I bought my FT890 from years back. He warned me that he would never sell one of those FT100's again, because of all the troubles, and stated none of them work. Well that really got me wondering.

I made such a ridiculous offer on the newsgroups hoping to illicit some sort of response, or maybe score a great deal, but nothing. This in fact shows me that true hams and FT owners are reasonable people that I can trust the advice of.

When it comes down to side by side comparison, I do realize each one has an equal number strengths and faults. I wanted the FT all along, but was scared by what I was seeing.

Well thanks to all, and hopefully I will catch some of you on the air from my new FT100, unless any of you closet IC706 guys watching this list, want to sell for $250.00 .

Ken may want to sell his ATAS. Perhas JimC wants to make him an offer.

The FC20 is controlled using the auxilliary tuner data cable (a serial port).

The FC20 works fine, but a manual BW300 tuner has a much wider tuning range.

Take care,
-Tom KB7EFZ

Subject: [FT100] FT-100 and ATAS-100 on 75mtrs????

From: "Chris Victor" <cvictor@...>

Here is a fwd msg from N6KB on his recent FT100/ATAS-100 pblms.

Does anybody in this reflector successfully use their ATAS-100 on 75mtrs [via a manual tunning method] that would preclude using a messing with the control menu
as a option ????

Hi Rich here,

I have the FT 100 with the ATAS antenna, it tunes the antenna on 20 meters and shows the OK SWR ICON but when I transmit it shows a high swr icon. I am making some adjustments here and there and I suspect a grounding problem. I am wondering if anyone has any ideas on grounding that have worked for them but still make the FT100 easy to remove from the vehicle. I just picked up the comet trunk lip mount and it is real nice, I will now ground the mount to the lid and ground the rig at its installation point. I am just wondering if anyone ran into this trouble and how they fixed it... Otherwise it works pretty well... Tnx Richy

Rich,

Which Comet mount did you use? The CQ5M? I found that this mount can start to separate due to the weight of the ATAS-100... and then the ground plain becomes intermittent...

Geoff

I have seen this behaviour on several bands. In each case it was attributable to poor RF grounding of the rig. My grounding solution is 1/2" wide tinned copper braid from each side of the rig to nearby floorpan penetrating screws. Works really well.
I think this may be due to having the initial tuneup being at a low power level, and then the actual transmission is higher, resulting in more "rf in the shack" getting into the rig (I've got a remote mounted control head).

Richy......You might try what I did to fix the high swr problem.....I
put a ferrite dough-nut under the ATAS100 and wrapped three turns of the
coax through the dough-nut. This fixed the high swr problem..Dale KC2PZ

I also had a problem on 20m, I took about 10 turns, 6" in diameter of coax to act a a balun at the back of the rig. This took the swr from 7 bars on the meter to 1 bar.

For some reason there is about a half dozen or so people on this list that flag ALL of their messages as High Priority. I belong to quite a few lists and this is the only one it happens on.

I respectfully request that people please stop doing this for general everyday run-of-the-mill type messages.

For most people its probably not a big deal, but for me personally it creates a huge chain of events that tracks me down automatically and forwards the message.

So, please refrain from using the High Priority flag unless it is necessary. I'd greatly appreciate it.

Respectfully,
Mike KF6SWI

Hi Rich, I had this problem after I had taken out my rig when my Explorer went in to the shop for a service check. I found that indeed it was caused by a poor ground. I had not tightened up the ground strap going to the radio and found that on several bands the ATAS-100 would tune just fine but if you went to full power transmit the High SWR would come on and lock out the transmitter. Fixing the poor ground cured the problem and enforced to me the need for proper grounding in a mobile installation. By the way I remote mount my radio and it has a 1/2 inch copper braid strap going from the radio to the body of the the vehicle. 73 Mark AB0HJ SS409SS@... wrote: > From: SS409SS@... > > Hi Rich here, > > I have the FT 100 with the ATAS antenna, it tunes the antenna on 20 meters > and shows the OK SWR ICON but when I transmit it shows a high swr icon. From: Jim LeFevre
Topic: 1495 Message: 1495

First, I really like my FT-100. Here is my question: when the radio is off, and my power supply is off, and I switch on my power supply, the FT-100 display briefly lights, accompanied by the sound of a relay click. The on/off works properly after this sequence. I haven't found anything in the manual stating anything about a "Power Handshake" and wonder if this is the norm, or if I have set the radio up wrong. Thanks all, Jim KB8UNU

That's a pretty clasic case of RF getting back into the rig. Ever since I ran a nice PHATT (opps, sorry, FAT - I just finished watching the MTV Video Music Awards) cable from the FT-100 RF deck to the car chassis, I NO LONGER get that error.

Ground that bad boy, then get jiggy wid it! Opps.... sorry again...

(Nothing important just a related experience -- long and basically worthless) Jim: Funny you should mention this. I was working on the installation in my truck which has an SGC tuner, two Mirage power amps and 2 low noise preamps connected to the FT-100 in adiition to an FT-8100 and some other minor stuff. I have a separate battery for the radio equipment (fed with a charge controller from the primary batteries) with a 50 Amp circuit breaker on the radio equipment. I was wiring up a contactor that uses a line from the FT-100 to power up the rest of the equipment when the FT-100 is turned on. When I was finally ready I closed the breaker and was surprised, "click-pop", everything powered up and immediatly powerd back down. My first reaction was that it was the breaker popping, so I spent the next 10 minutes looking for where I had messed up. When I was convinced that it was all right, I reset the breaker and tried again, "click-pop", same thing. Now the really funny thing here is that I spent the next half hour trying to figure where the load was that was popping my breaker, but never bothered to see if the breaker was actually tripping, which of course it wasn't (I never really looked at it, just was resetting it which would turn the power off then back on when I closed it again). Finally, I realized that the FT-100 was powering up and down and of course the contactor was following it. I guess every once in a while I need one of these experiences to remind me that I need to look at what I'm doing if I don't want to waste a bunch of time. Well, in any case, the installation is fine and using the FT-100 power to bring up everything else is working. I still have some audio distribution, amp and inside and outside speakers to install and 2 more antennas, but I'm getting there. If you're still reading this, I have a question. Does anyone know of a good low profile weather proof speaker I can put between the roof of the truck and my roof rack. I'd like something that radiates in all directions. It needs to be able to withstand rain, snow, ice and the occasional tree branch that manages to get wedged into the roof rack. Any input would be appreciated. You are seeing things ONLY from your point of view. Mike was making the point that he is required to use a system that TRACKS HIM DOWN.

He obviously CANNOT filter out urgent/high priority messages. He NEEDS to be notified at all times and in all places and MUST have all such messages FORWARDED TO HIM.

PLEASE, express yourself with more TACT and COMPASSION, and consider how you would feel if you had others yanking your chain 24/7 with banal, mundane, humdrum.

Mike's request was not surly. Your response should not have been surly.

AAAHHH You drilled a hole in a new Volvo!! :-) My wife would kill me.. Richy
Looks like a neat setup, I just installed a trunk lip mount for the ATAS and use a cushcraft dual bander (magnetic mount) for 2m and 440.. I figured the duplexer was the problem to begin with so I eliminated it from the equation.. I am going to use everones suggestions on grounding and I will pass the info along on how it works out...Regards Richy

I have been using a comet duplexer (cf-706) since april 1 with a screwdriver antenna running 600w (of course the duplexer is only seeing 100w max) and a tri-band comet antenna with no problems at all, with radio, or antenna's. Just thought I'd pass that info on.

What is the difference in tuning range? I've been interested in getting an antenna tuner, but I"m still pretty new to ham radio, and have been trying to learn more before I make my choice.

Look also the quality of the coax cable. I ran into intermittent problems like that for some time. It runed out to be a 6 foot length of coax cable that was the trouble. Replaced it, and no more intermitent swr problems. William > > I have the FT 100 with the ATAS antenna, it tunes the antenna on 20 meters >and shows the OK SWR ICON but when I transmit it shows a high swr icon. I am >making some adjustments here and there and I suspect a grounding problem. I >am wondering if anyone has any ideas on grounding that have worked for them >but still make the FT100 easy to remove from the vehicle. I just picked up >the comet trunk lip mount and it is real nice, I will now ground the mount to >the lid and ground the rig at its installation point. I am just wondering if >anyone ran into this trouble and how they fixed it... Otherwise it works >pretty well... Keep in mind that antenna tuners do not tune antennas. 73, Jim KB6SX -----Original Message----- From: William Mastop To: FT100@onelist.com Date: Sunday, September 12, 1999 4:33 PM Subject: Re: [FT100] FT-100 and ATAS-100 on 75mtrs???? >From: "William Mastop" > >What is the difference in tuning range?
